5 Remote Shell Present Vulnerability

port 1524/tcp

QID: 38087
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/02/2014
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The presence of a remote shell that does not require any form of authentication was detected. This may be an indication that this host was previously hacked into and malicious programs were installed.

IMPACT:

The successful exploitation of this vulnerability could lead to a complete compromise of the host.

SOLUTION:

You should take immediate actions to remove this vulnerability.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

```
]0;@0fae9a50e134: /root@0fae9a50e134:/#
```

4 Remote Execution Service Open

QID: 38021
Category: General remote services
Associated CVEs: [CVE-1999-0618](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 12/17/2021
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The "Remote Execution" (rexec) service, which uses TCP port number 512, was detected on this host. This service is based on a login/password authentication procedure and allows remote users to execute commands on the system. rexec uses a protocol similar to the

rshd/rlogind apart from the .rhosts and /etc/host.equiv authentication (where no password is required)

IMPACT:

If unauthorized users manage to obtain information about the login names of the users on your system (by using "finger", for example), then they can try to brute force accounts by testing login/password combinations. Compared to many telnet daemons that deny login as root, rexec allows remote users with the correct password to execute commands as root.

SOLUTION:

We strongly advise that you remove the "rexec" service from your system. If an alternative is required, we recommend installing Secure Shell (SSH) which has the same features as the "r*" services" daemon, but also adds an encryption layer on top of the protocol to prevent eavesdropping and provide better authentication.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Detected service rsh/rexec and os UNKNOWN

 4 TFTP Daemon Theft of '/etc/passwd' file

QID:	38064
Category:	General remote services
Associated CVEs:	CVE-1999-0183
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	05/29/2009
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

TFTP (Trivial File Transfer Protocol) is generally used to load a boot file from a server when a client does not have a disk to boot from.

The TFTP protocol does not have any access control. Therefore, unauthorized users can connect to this daemon from a remote system and download or upload files without a password. Some older versions of this FTP protocol contain vulnerabilities that give unauthorized users direct access to all files on your filesystem.

IMPACT:

If the default working directory of the TFTP daemon is '/tftpboot', then unauthorized users can request that the server transfer the '/etc/passwd' or '../etc/passwd' files. This could lead to further attacks against the host.

SOLUTION:

Be sure to use the latest version of the TFTP daemon, which should deny transfer of files that are not in the working directory of the TFTP daemon (/tftpboot).

We strongly advise that you only make files in the /tftpboot directory accessible. This can usually be done by modifying the /usr/sbin/in.tftpd entry in your /etc/inetd.conf file to include 'tftpboot' as the first argument. For more information, see the man pages of the tftpd daemon.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

4 Remote User List Disclosure Using NetBIOS

QID:	45003
Category:	Information gathering
Associated CVEs:	CVE-2000-1200
Vendor Reference:	-
Bugtraq ID:	959
Service Modified:	02/28/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

A null session connection to the IPC\$ share was successful. NetBIOS access can be obtained with any authenticated account on this host. Therefore unauthorized users can steal the remote user list. This kind of attack is commonly exploited by users with weak passwords, such as the GUEST account.

Please note that this QID is posted when Qualys is able to enumerate the user-list of a target via the Net* API functions (in which case QID 70003 is posted as well), or when Qualys is able to "brute-force" known SIDs via LsarLookupSids (in which case only QID 45003 is posted). While both techniques use anonymous NetBIOS sessions, we are unaware of a system-level fix for LsarLookupSids, as Microsoft considers this to be requisite functionality.

IMPACT:

By exploiting this vulnerability, unauthorized users can launch brute force password attacks and other intrusive attacks based on collected information. Employee, customer, and partner information may be gathered. Spamming the user list is also possible.

SOLUTION:

It is recommended that you disable null sessions.

Before editing any configuration file in a production environment, the changes should be well tested in a rehearsal environment.

Read the Microsoft documents called How to Use the RestrictAnonymous Registry Value and Restricting Anonymous Access for more information. If this vulnerability was discovered on a domain controller, please note that some of the recommended settings may not have any effect. Read the Microsoft article Description of Dcpromo Permissions Choices for more information regarding Pre-Windows 2000 Compatible Access.

For Windows NT, setting this registry value limits only certain interfaces to this data. It is not possible to completely eliminate this vulnerability through a registry setting.

There is another interesting Microsoft document called Local Policies ([http://technet.microsoft.com/en-us/library/cc772979\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc772979(v=ws.10).aspx)) about Windows security policies settings for local policies.

Windows XP onwards Microsoft has added more granular control to the anonymous user access by adding couple of more DWORD registry values in the same key location as RestrictAnonymous, RestrictAnonymousSAM and EveryoneIncludesAnonymous. Set RestrictAnonymous = 1 to restrict share information access, RestrictAnonymousSAM = 1 to prevent enumeration of SAM accounts (User Accounts) and EveryoneIncludesAnonymous = 0 to prevent null-sessions from having any rights. Setting the RestrictAnonymous value to 1 restricts null session access to unauthenticated users to all server pipes and shares except those listed in the NullSessionPipes and NullSessionShares entries. Additionally set HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\lanmanserver\parameters, NullSessionPipes and NullSessionShares, to a null string.

For Samba servers there is no direct way of disabling null session access. A workaround is to specify a non existing UNIX account in global section of Samba config file. guest account = NON EXISTING USER.

Adding 'restrict anonymous = 2' in smb.conf can help resolve the issue.

Note: Please be aware that changing the restrictanonymous setting to the highest security level for example restrictanonymous = 2 in windows 2000 may disable older programs that make use of this account. It will also affect Windows NT 4.0 Domain Controllers from communicating with each other between trust relationships.

If possible, filter out Microsoft networking ports such as TCP ports 135, 137, 138, 139, and UDP ports 135, 137, 138.

4 Null Session/Password NetBIOS Access

QID: 70003
 Category: SMB / NETBIOS
 Associated CVEs: [CVE-1999-0519](#)
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 04/07/2022
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

Unauthorized users can connect to this NetBIOS service without a password.

IMPACT:

Unauthorized users may be able to exploit this vulnerability to obtain sensitive information about your system resources, such as a list of all accounts or shared resources on this host. For Windows hosts, unauthorized users may also be able to access the registry, and depending on the Windows version and registry permission settings, make modifications to the registry.

SOLUTION:

Null NetBIOS sessions can be disabled using the following methods:

Windows NT: 1. Set the following registry key:

HKLM\System\CurrentControlSet\Control\Lsa

Name: RestrictAnonymous

Type: REG_DWORD Value: 1

2. Restart your computer.

Windows 2000:

1. Start "Control Panel-->Administrative Tools-->Local Security Policy".

2. Open "Local Policies-->Security Options".

3. Make sure "Additional restrictions of anonymous connections" is set to "No access without explicit anonymous permissions".

4. Restart your computer.

Windows XP/2003: 1. Start "Control Panel-->Administrative Tools-->Local Security Policy".
2. Open "Local Policies-->Security Options".
3. Make sure the following two policies are enabled:
* Network Access: Do not allow anonymous enumeration of SAM accounts
* Network Access: Do not allow anonymous enumeration of SAM accounts and shares
4. Disable Network Access: Let Everyone permissions apply to anonymous users.
5. Restart your computer. The above settings have no impact on domain controllers. If this vulnerability was discovered on a domain controller, recommended settings may not have any effect. Samba:
Make the following settings in smb.conf:
* set "security" to "user" or "domain" or "server" as per your requirements.
* set "map_to_guest" to "Never"

SECURITY = USER
This is the default security setting in Samba 2.2. With user-level security a client must first "log-on" with a valid username and password (which can be mapped using the username map parameter). Encrypted passwords can also be used in this security mode. Parameters such as user and guest only if set are then applied and may change the UNIX user to use on this connection, but only after the user has been successfully authenticated.

SECURITY = SERVER
In this mode Samba will try to validate the username/password by passing it to another SMB server, such as an NT box. If this fails it will revert to security = user, but note that if encrypted passwords have been negotiated then Samba cannot revert back to checking the UNIX password file, it must have a valid smbpasswd file to check users against. See the documentation file in the docs/ directory ENCRYPTION.txt for details on how to set this up.

SECURITY = DOMAIN
This mode will only work correctly if smbpasswd has been used to add this machine into a Windows NT Domain. It expects the encrypted passwords parameter to be set to true. In this mode Samba will try to validate the username/password by passing it to a Windows NT Primary or Backup Domain Controller, in exactly the same way that a Windows NT Server would do.

Also add "restrict anonymous = 2" to the "[global]" configuration section.
Note: Setting this parameter in Samba versions prior to 4 may impact Samba's ability to service Windows 9x clients, act as a Domain Controller or serve as the Master Browser.

Windows Server 2008,2012,2016 Disable Server 2008 Null Sessions
(<http://social.technet.microsoft.com/Forums/en-US/winservergen/thread/841523db-8c4b-43a0-9f28-be7270f92e2b>), Disable Server Null Sessions

 4 TWiki TWikiUsers Remote Arbitrary Command Execution Vulnerability

port 80/tcp

QID:	12193
Category:	CGI
Associated CVEs:	CVE-2005-2877
Vendor Reference:	-
Bugtraq ID:	14834
Service Modified:	02/28/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

TWiki is a Web-based application that allows creation and maintenance of Web sites using a Web browser. It is implemented in Perl CGI.
A remote command execution vulnerability affects the application. This issue is due to a failure of the application to properly validate user access to sensitive configuration options.

The revision control function of the TWikiUsers script uses the backtick shell metacharacter to construct a command line. User-supplied data passed through the "rev" parameter is not properly sanitized for shell metacharacters, allowing an attacker to use a specially crafted URI to execute arbitrary commands through the shell.

IMPACT:

A successful attack would occur in the context of the vulnerable application and can facilitate unauthorized remote access.

SOLUTION:

The vendor has released a patch to address this issue. Refer to TWiki's Web site (<http://twiki.org/cgi-bin/view/Codev/SecurityAlertExecuteCommandsWithRev>) for patches.

4 Weak SSL/TLS Key Exchange

port 5432/tcp over SSL

QID: 38863
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 03/03/2023
User Modified: -
Edited: No
PCI Vuln: Yes

IMPACT:

An attacker with access to sufficient computational power might be able to recover the session key and decrypt session content.

SOLUTION:

Change the SSL/TLS server configuration to only allow strong key exchanges. Key exchanges used on the server should provide at least 112 bits of security, so the minimum key size to not flag this QID should be:
2048 bit key size for Diffie Hellman (DH) or RSA key exchanges
224 bit key size for Elliptic Curve Diffie Hellman (EDCH) key exchanges.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

PROTOCOL	CIPHER	NAME	GROUP	KEY-SIZE	FORWARD-SECRET	CLASSICAL-STRENGTH	QUANTUM-STRENGTH

3 Remote Shell Service Open

QID: 38020
Category: General remote services

Associated CVEs: [CVE-1999-0651](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 12/12/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The "Remote Shell" (RSH) service, which uses TCP port number 514, was detected on this host. If this service is accessible from remote hosts, then the server's host can be compromised because of a problem in the service's trust in IP addresses.

Malicious users heavily exploit the RSH service to log onto hosts in trust relationships. Remote users do not need a password to log into accounts that the ".rhosts" file has authorized them for. This can be done for all users with a general file called "/etc/hosts.equiv".

Two plus signs (+ +) in an ".rhosts" file translates to "anybody can log into my account without having to supply a password". A line with a single plus sign (+) in the "/etc/hosts.equiv" file translates to "any user on any system that can connect to this machine can log into the same user name on this machine provided it exists on the local host".

IMPACT:

By exploiting this vulnerability, unauthorized users can impersonate a trusted machine to log in without a password, such as MiTM attack. It may allow poorly authenticated logins without passwords. If the host is vulnerable to TCP sequence number guessing (from any network) or IP spoofing (including ARP hijacking on a local network) then it may be possible to bypass authentication.

SOLUTION:

Since host-based access controls are not very secure, you should choose a more secure access protocol. The rsh service is known to be very insecure. The service should be disabled.

To disable the service comment out the "rsh" line in /etc/inetd.conf.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

CVE-1999-0651 (<https://www.cvedetails.com/cve/CVE-1999-0651/>)

Vendor Reference: -
Bugtraq ID: 2886,2331
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

A TFTP server gives remote systems the ability to get or put files via the Trivial File Transfer Protocol (TFTP).

Some TFTP servers do not validate input. It is possible for a remote user to connect to the TFTP server, and upon connecting, request a file in the directory above the TFTP root directory using the dot-dot notation (..). Upon doing so, a remote user may traverse the entire directory structure, and potentially download any file contained within the directory tree of the drive hosting the TFTP root directory.

IMPACT:

By exploiting this vulnerability, a remote user may be able to traverse the entire directory structure, and potentially download any file contained within the directory tree of the drive hosting the TFTP root directory.

SOLUTION:

Set the TFTP Server to run in a chrooted environment,

COMPLIANCE:

3 Remote Management Service Accepting Unencrypted Credentials Detected (Telnet)

QID: 48168
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/10/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

A remote management service that accepts unencrypted credentials was detected on the target host.

Services like Telnet with basic auth are checked.

IMPACT:

A malicious individual can easily intercept unencrypted passwords during transmission using a "network sniffer" and use this data to gain unauthorized access.

SOLUTION:

If possible, use alternate services that provide encryption.
Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Service name: Telnet on TCP port 23.

 3 Remote Management Service Accepting Unencrypted Credentials Detected (FTP)

QID: 48169
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/24/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

A remote management service that accepts unencrypted credentials was detected on the target host.
Services like FTP with basic auth are checked.

IMPACT:

NA

SOLUTION:

If possible, use alternate services that provide encryption.
Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission.

COMPLIANCE:

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Service name: FTP on TCP port 21.

 3 NetBIOS Shared Folder List Available

QID: 70001
Category: SMB / NETBIOS
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 10/14/2011
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Unauthorized remote users can list all file systems on this host that are accessible from a remote system.

IMPACT:

If successfully exploited, unauthorized users can use this information to brute force attack the shared resources and initiate file transfers with this server.

SOLUTION:

Use the Microsoft Computer Management MMC snap-in to connect and review the shares. By default C\$, Admin\$, and IPC\$ are shared on all Windows machines.

Review the machine to ensure that users have not added any additional unauthorized shares, and that all exposed shares are valid .

If no shares are needed, you can filter all Microsoft networking and Samba server ports (TCP ports 135, 137, 138, 139, 445 and UDP ports 135, 137, 138) at your firewall and disable null sessions to NetBIOS.

A suggested workaround.

Before editing any configuration file in a production environment, the changes should be well tested in a rehearsal environment.

Adding 'restrict anonymous = 2' in smb.conf can help resolve the issue.

A workaround method for non-domain machines is to modify the local policy.

1. Navigate to Administrative tools.
2. Open "Local Security Policy Settings"
3. Click the plus sign of the folder named "Local Policies"
4. Select "Security Options" within the "Local Policies" folder
6. Browse to the policy "Network access: Do not allow anonymous enumeration of SAM accounts and shares"
7. Enabled the policy. For Servers this is disabled by default.
8. Reboot the computer for the changes to take effect.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Device Name	Comment	Type

3 WINS Domain Controller Spoofing Vulnerability

QID: 70007
Category: SMB / NETBIOS
Associated CVEs: [CVE-1999-1593](#)
Vendor Reference: -
Bugtraq ID: 2221
Service Modified: 01/26/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Windows Internet Naming Service (WINS) ships with Microsoft Windows NT Server and is also supported by Samba server. WINS resolves IP addresses with network computer names in a client to server environment. A distributed database is updated with an IP address for every machine available on the network. Unfortunately, WINS does not properly verify the registration of Domain Controllers (DCs).

It's possible for a user to modify the entries for a domain controller, causing the WINS service to redirect requests for the DC to another system. This can lead to a loss of network functionality for the domain. The DC impersonator can also be set up to capture username and password hashes passed to it during login attempts.

IMPACT:

By exploiting this vulnerability, an unauthorized user can cause the WINS service to redirect requests for a domain controller to a different system, which could lead to a loss of network functionality. The user may also be able to retrieve username and password hashes.

SOLUTION:

There are no vendor supplied patches available at this time.

Workaround: The following workaround was provided by David Byrne <dbyrne@tiaa-cref.org>:

The best workaround I could think of is to use static entries for records that are sensitive (there are probably more besides 1Ch). Domain Controllers shouldn't be changed very often, so the management work would be minimal.

The following workaround was provided by Paul L Schmehl <pauls@utdallas.edu>:

MS's response was that because WINS uses NetBIOS, which has no security capabilities, there was no way to prevent that sort of hijacking. Their answer is Active Directory, Kerberos and DNS.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 nist-nvd2

Reference: CVE-1999-1593

Description: Windows Internet Naming Service (WINS) allows remote attackers to cause a denial of service (connectivity loss) or steal credentials via a 1Ch registration that causes WINS to change the domain controller to point to a malicious server. NOTE: this problem may be limited when Windows 95/98 clients are used, or if the primary domain controller becomes unavailable.

Link: https://www2.sans.org/reading_room/whitepapers/win2k/185.php

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Found through udp port 137

3 NetBIOS Name Conflict Vulnerability

QID: 70008
Category: SMB / NETBIOS
Associated CVEs: [CVE-2000-0673](#)
Vendor Reference: [MS00-047](#)
Bugtraq ID: 1514,1515
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

A malicious user can send a NetBIOS Name Conflict message to the NetBIOS name service even when the receiving machine is not in the process of registering its NetBIOS name. As a result, the target will not attempt to use that name in any future network connection attempts, which could lead to intermittent connectivity problems, or the loss of all NetBIOS functionality.

This is a design flaw problem in the NetBIOS protocol and the WINS dynamic name registration, which is present whenever WINS is supported.

IMPACT:

If successfully exploited, this vulnerability could lead to intermittent connectivity problems, or the loss of all NetBIOS functionality.

SOLUTION:

The best workaround for Microsoft Windows and Samba Server is to block all incoming traffic from the Internet to UDP ports 137 and 138.

For Windows platforms, microsoft has released some patches to address this issue.

Microsoft has released a patch (Hotfix 269239). After the patch is applied, conflict messages will only be responded to during the initial name registration process. For more information on this vulnerability and the patch, read Microsoft Security Bulletin (MS00-047) (<http://www.microsoft.com/technet/treeview/default.asp?url=/TechNet/security/bulletin/MS00-047.asp>).

Hotfix 269239 mitigates the issue by generating log events for detected name conflicts. Note that while Hotfix 269239 provides notification when name conflicts occur, the system remains vulnerable. Microsoft acknowledges this problem in their documentation for Hotfix 269239.

The following is a list of Microsoft patches:

Microsoft Windows NT 4.0 patch Q269239i (<http://www.microsoft.com/downloads/release.asp?ReleaseID=22138>)

Microsoft Windows NT Terminal Server patch Q269239i (<http://www.microsoft.com/downloads/release.asp?ReleaseID=24516>)

Microsoft Windows 2000 patch Q269239_W2K_SP2_x86_en
(http://download.microsoft.com/download/win2000platform/Patch/q269239/NT5/EN-US/Q269239_W2K_SP2_x86_en.EXE)

For Samba there are no vendor supplied patches available at this time.

COMPLIANCE:

Not Applicable

3 NetBIOS Release Vulnerability

QID: 70009
Category: SMB / NETBIOS
Associated CVEs: [CVE-2000-0673](#)
Vendor Reference: [MS00-047](#)
Bugtraq ID: 1515,1514

Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

A malicious user can send a NetBIOS Release message to a NetBIOS name service.

IMPACT:

If successfully exploited, the receiving machine is forced to place its name in conflict so that it will no longer be able to use it.

SOLUTION:

This is the correct protocol behavior. The best workaround for Microsoft Windows and Samba servers is to block all incoming traffic from the Internet to UDP ports 137 and 138.

Also for Windows, Microsoft has released a patch (Hotfix 269239), which adds a registry key that disables the NetBIOS name service from paying attention to these messages. For more information on this vulnerability and the patch, read Microsoft Security Bulletin (MS00-047) (<http://www.microsoft.com/technet/treeview/default.asp?url=/TechNet/security/bulletin/MS00-047.asp>).

Hotfix 269239 mitigates the issue by generating log events for detected name conflicts. Note that while Hotfix 269239 provides notification when name conflicts occur, the system remains vulnerable.

Microsoft acknowledges this problem in their documentation for Hotfix 269239.

The following is a list of Microsoft patches:

Microsoft Windows 2000 (Professional, Server, and Advanced Server) Patch (<http://www.microsoft.com/Downloads/Release.asp?ReleaseID=23370>)

Microsoft Windows NT 4.0 (Workstation, Server, and Server, Enterprise Edition) Patch (<http://www.microsoft.com/Downloads/Release.asp?ReleaseID=22138>)

Microsoft Windows NT Server 4.0 (Terminal Server Edition) Patch (<http://www.microsoft.com/Downloads/Release.asp?ReleaseID=24516>)

Windows 2003 inherently supports the registry value for ignoring Name release mentioned in the MS00-047 document. Please refer the document MS00-047 for information on configuring this registry value.

For Samba server there are no vendor supplied patches available at this time.

3 Apache HTTP Server HttpOnly Cookie Information Disclosure Vulnerability

QID: 87120
Category: Web server
Associated CVEs: [CVE-2012-0053](#)
Vendor Reference: [Apache 2.2, IBM HTTP Server](#)
Bugtraq ID: 51706
Service Modified: 11/06/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

A flaw was found in the default error response for status code 400. This flaw could be used by an attacker to expose "httpOnly" cookies when no custom ErrorDocument is specified.

Affected Versions:

Apache HTTP Server 2.2.0 through to 2.2.21.

IBM HTTP Server prior to 6.1.0.43, 7.0.0.23, 8.0.0.3

IMPACT:

Successfully exploiting this vulnerability might allow a remote attacker to get access to sensitive information.

SOLUTION:

This issue has been patched in Apache 2.2.22. Refer to Apache 2.2 Security Vulnerabilities (http://httpd.apache.org/security/vulnerabilities_22.html). IBM also released updated versions to fix this vulnerability. Refer to IBM HTTP Server Advisory (<http://www-01.ibm.com/support/docview.wss?uid=swg1PM56128>).

Workaround: Specifying a custom ErrorDocument with "hardcoded plaintext" mitigates the issue. Refer to Apache ErrorDocument Directive (<http://httpd.apache.org/docs/2.2/mod/core.html#errordocument>) for more information.

Please note that ErrorDocument setting using "path" or "external URL" does not mitigate this issue.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

RESULTS:

Apache HTTP Server httpOnly Cookie Information Disclosure Vulnerability detected on port 80.

3 SMB Signing Disabled or SMB Signing Not Required

QID: 90043
Category: Windows
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 10/25/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

This host does not seem to be using SMB (Server Message Block) signing. SMB signing is a security mechanism in the SMB protocol and is also known as security signatures. SMB signing is designed to help improve the security of the SMB protocol.

SMB signing adds security to a network using NetBIOS, avoiding man-in-the-middle attacks.

When SMB signing is enabled on both the client and server SMB sessions are authenticated between the machines on a packet by packet basis.

IMPACT:

Unauthorized users sniffing the network could catch many challenge/response exchanges and replay the whole thing to grab particular session keys, and then authenticate on the Domain Controller.

SOLUTION:

Without SMB signing, a device could intercept SMB network packets from an originating computer, alter their contents, and broadcast them to the destination computer. Since, digitally signing the packets enables the recipient of the packets to confirm their point of origination and their authenticity, it is recommended that SMB signing is enabled and required.

Please refer to Microsoft's article 887429 (<http://support.microsoft.com/kb/887429>) and The Basics of SMB Signing (covering both SMB1 and SMB2) (<https://docs.microsoft.com/en-us/archive/blogs/josebda/the-basics-of-smb-signing-covering-both-smb1-and-smb2>) for information on enabling SMB signing.

For Windows Server 2008 R2, Windows Server 2012, please refer to Microsoft's article Require SMB Security Signatures (<http://technet.microsoft.com/en-us/library/cc731957.aspx>) for information on enabling SMB signing. For group policies please refer to Microsoft's article Modify Security Policies in Default Domain Controllers Policy (<http://technet.microsoft.com/en-us/library/cc731654>)

For UNIX systems

To require samba clients running "smbclient" to use packet signing, add the following to the "[global]" section of the Samba configuration file:

client signing = mandatory

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

3 Samba Security Update (RHSA-2007:0354)

QID: 115555
Category: Local
Associated CVEs: [CVE-2007-2446](#)
Vendor Reference: [RHSA-2007:0354](#)
Bugtraq ID: 23973,25159,24198,24197,24196,24195
Service Modified: 09/02/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba provides file and printer sharing services to SMB/CIFS clients. It is susceptible to the following vulnerabilities.

A heap overflow vulnerability because of bugs in NDR parsing, which are used to decode MS-RPC requests. (CVE-2007-2446)

A remote code execution vulnerability because user input parameters are being passed directly to /bin/sh. (CVE-2007-2446)

IMPACT:

A malicious attacker can send carefully crafted packets to the server, causing a heap overflow leading to remote code execution.

SOLUTION:

Refer to Red Hat security advisory RHSA-2007:0354 (<http://rhn.redhat.com/errata/RHSA-2007-0354.html>) for patches and further details.

HP has released a patch to address this issue. Refer to HP's technical support document HPSBUX02218 (http://www11.itrc.hp.com/service/cki/docDisplay.do?docLocale=en&docId=emr_na-c01067768-1) (registration required) for further details.

Patch:

coreimpact

Reference: CVE-2007-2446

Description: Samba lsa_io_trans_names buffer overflow exploit

Link: <https://www.coresecurity.com/core-labs/exploits>

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Samba 3.0.20-Debian

3 Samba "domain logons" remote code execution (Sun Solaris 1019295.1) (RHSA-2007:1114)

QID: 115822
Category: Local
Associated CVEs: [CVE-2007-6015](#)
Vendor Reference: [Oracle ID 1019295.1](#), [RHSA-2007:1114](#), [HP-UX doc c01475657](#)
Bugtraq ID: 26791
Service Modified: 05/27/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

A stack-based buffer overflow security issue exists in the send_mailslot function in nmbd(8) in Samba Versions 3.0.0 through 3.0.27a when the "domain logons" option is enabled.

IMPACT:

This vulnerability may allow a remote unprivileged user the ability to execute arbitrary code as "root" user via a GETDC mailslot request composed of a long GETDC string following an offset username in a SAMLOGON logon request.

SOLUTION:

Vendor has released update to resolve this issue. Refer to advisory Samba-2007-6015 (<http://www.samba.org/samba/security/CVE-2007-6015.html>).

Sun has released patches to address this issue. Refer to Oracle ID 1019295.1

(<https://support.oracle.com/CSP/main/article?cmd=show&type=NOT&id=1019295.1>) for patch details.

Refer to Red Hat security advisory RHSA-2007-1114 (<http://rhn.redhat.com/errata/RHSA-2007-1114.html>)

Refer to HP-UX advisory c01475657 (http://www11.itrc.hp.com/service/cki/docDisplay.do?docId=emr_na-c01475657).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Description: Samba 3.0.27a - 'send_mailslot()' Remote Buffer Overflow - The Exploit-DB Ref : 4732

Link: <http://www.exploit-db.com/exploits/4732>

exploitdb

Reference: CVE-2007-6015

Description: Samba 3.0.27a - 'send_mailslot()' Remote Buffer Overflow

Link: <https://www.exploit-db.com/exploits/4732>

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Samba 3.0.20-Debian

3 phpinfo Information Disclosure Vulnerability

port 80/tcp

QID: 10464
Category: CGI
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 07/18/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

This host has a publicly-accessible PHP file that calls the phpinfo() function (or some other function similar to it).

If a user requests this file (such as via an Internet browser), the user may obtain a page containing sensitive information about the Web server host. The information displayed to the user could include the exact version numbers of various software products (Operating Systems, Web Servers, PHP, XML, MySQL), the values of some environment variables (\$PATH, \$SYSTEM_ROOT), paths to various programs (cmd.exe), and much more.

To get specific information about the type of data your host displayed, please refer to the "Result" field below.

IMPACT:

By exploiting this vulnerability, any user could obtain very sensitive information about the Web server host. This information may aid in attacks against the host.

SOLUTION:

You should immediately remove all such files from the public domain on your Web server.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

HTTP/1.1 200 OK
Date: Thu, 23 Jul 2026 07:21:43 GMT
Server: Apache/2.2.8 (Ubuntu) DAV/2

3 Specific CGI Cross-Site Scripting Vulnerability

port 80/tcp

QID: 12181
 Category: CGI
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 11/26/2020
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

When the service made an HTTP request for a CGI file that was found to exist on the Web server host, the Web server returned an HTTP page containing unsanitized user-supplied input to at least one of the CGI file's parameters. Thus the host is vulnerable to cross-site scripting attacks.

A list of CGI vulnerable files can be found in the Result section below.

IMPACT:

By exploiting this vulnerability, malicious scripts could be executed in a client browser which processes the content of the HTTP page returned by the Web server.

SOLUTION:

Contact the vendor/author of the CGI file(s) for a solution to this issue.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

GET /twiki/bin/edit/Sandbox/TestTopic1?topicparent="><script>alert(document.domain)</script> HTTP/1.1

3 Web Server Uses Plain-Text Form Based Authentication

port 80/tcp

QID: 86728
Category: Web server
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 08/25/2020
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Web server uses plain-text form based authentication. A web page exists on the target host which uses an HTML login form. This data is sent from the client to the server in plain-text.

IMPACT:

An attacker with access to the network traffic to and from the target host may be able to obtain login credentials for other users by sniffing the network traffic.

SOLUTION:

Please contact the vendor of the hardware/software for a possible fix for the issue. For custom applications, ensure that data sent via HTML login forms is encrypted before being sent from the client to the host.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

3 Deprecated SSH Cryptographic Settings

port 22/tcp

QID: 38739
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/11/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another.

The target is using deprecated SSH cryptographic settings to communicate.

IMPACT:

A man-in-the-middle attacker may be able to exploit this vulnerability to record the communication to decrypt the session key and even the messages.

SOLUTION:

Avoid using deprecated cryptographic settings.

Use best practices when configuring SSH.

Refer to Security of Interactive and Automated Access Management Using Secure Shell (SSH) (<https://csrc.nist.gov/publications/detail/nistir/7966/final>) .

Settings currently considered deprecated:

1.Ciphers using CFB or OFB:

These are considered uncommon and deprecated due to vulnerabilities when compared to newer cipher chaining modes such as CTR or GCM.

2.RC4 cipher (arcfour, arcfour128, arcfour256):

The RC4 cipher is no longer considered secure and exhibits cryptographic bias.

3.Ciphers with a 64-bit block size (DES, 3DES, Blowfish, IDEA, CAST):

These ciphers may be vulnerable to birthday attacks (Sweet32).

4.Key exchange algorithms using DH group 1 (diffie-hellman-group1-sha1, gss-group1-sha1-*):

DH group 1 uses a 1024-bit key size, which is considered too short and vulnerable to Logjam-style attacks.

5.Key exchange algorithm "rsa1024sha1":

This algorithm is very uncommon and deprecated due to its short RSA key size.

6.MAC algorithm "umac-32":

This algorithm is extremely uncommon and deprecated due to its very short MAC length.

7.Cipher "none":

This cipher is available only in SSHv1.

8.MAC algorithm "MD5":

All MD5 based mac algorithms are deprecated.

9.96-bit MAC:
both sha1 and sha2 variants of 96 bit macs are considered deprecated.

10.CBC Ciphers:
All CBC Ciphers are deprecated.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Type	Name

3 Secure Sockets Layer/Transport Layer Security (SSL/TLS) Compression Algorithm Information Leakage Vulnerability

port 5432/tcp over SSL

QID: 38599
Category: General remote services
Associated CVEs: [CVE-2012-4929](#)
Vendor Reference: -
Bugtraq ID: 55704
Service Modified: 06/06/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

SSL/TLS protocols support and optional compression algorithm. When used compression can ease data transfer significantly.

An information leakage was discovered related to compression algorithms used in SSL/TLS protocols. The attacker needs to have the ability to submit any plain text to the compression and encryption process and observe the output to be able to exploit this vulnerability.

The attack works like this:

the attacker who has control over a web browser that is communicating to a web site that uses SSL/TLS can send a HTTP POST request that looks like this:

POST /login.php HTTP/1.1

Cookie: XYZ

Cookie:

The first Cookie is in the HTTP header and the second one is in the body of the request.

If a compression algorithm is used it will replace the second occurrence of the string 'Cookie: ' by a reference to the first one and thus decrease the length of the string to be encrypted and eventually the output length of SSL packet. This can be observed on the network. The attacker can then prepare another request that contains a guess as to what the first character of the cookie is. That HTTP request looks like this:

```
POST /login.php HTTP/1.1
Cookie: XYZ
```

Cookie: A

If the guess was correct then the length of the output of compression + encryption will decrease more than if the guess was incorrect. Using this approach the attacker can verify their guesses and completely recover the value of the cookie.

IMPACT:

Typically cookies are used in secure HTTP sessions as authentication tokens and as session identifications. Compromise of the cookie can lead to HTTP session hijacking and impersonation.

SOLUTION:

Compression algorithms should be disabled. The method of disabling it varies depending on the application you're running. If you're using a hardware device or software not listed here, you'll need to check the manual or vendor support options.

For IIS SSL Compression is referred to as HTTP compression. It can be disabled from IIS configuration->Web Site->Properties->Service (tab). HTTP Compression checkboxes need to be turned off.

For Redhat systems with Zlib Compression.

- Set the OPENSSL_NO_DEFAULT_ZLIB environment variable can be used to disable zlib compression support.
- Further details can be found under Bugzilla Redhat 857051. (https://bugzilla.redhat.com/show_bug.cgi?id=857051#c5)

For other HTTP servers please check the vendors documentation on how to disable SSL compression.

Best practices for SSL/TLS Deployment can be found at QUALYS SSL Labs. (<https://www.ssllabs.com/>)

3 Secure Sockets Layer/Transport Layer Security (SSL/TLS) Use of Weak Cipher Rivest Cipher 4 (RC4/ARC4/ARCFOUR)

port 5432/tcp over SSL

QID:	38601
Category:	General remote services
Associated CVEs:	CVE-2013-2566 , CVE-2015-2808
Vendor Reference:	-
Bugtraq ID:	91787,58796,73684
Service Modified:	05/29/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Secure Sockets Layer (SSL v2/v3) and Transport Layer Security (TLS) protocols provide integrity, confidentiality and authenticity services to other protocols that lack these features.

SSL/TLS protocols use ciphers such as AES,DES, 3DES and RC4(Arcfour) to encrypt the content of the higher layer protocols and thus provide the confidentiality service. Normally the output of an encryption process is a sequence of random looking bytes. It was known that RC4 output has some bias in the output. Recently a group of researchers has discovered that there is a stronger bias in RC4(Arcfour) , which makes statistical analysis of ciphertext more practical.

The described attack is to inject a malicious javascript into the victim's browser that would ensure that there are multiple connections being established with a target website and the same HTTP cookie is sent multiple times to the website in encrypted form. This provides the attacker a large set of ciphertext samples that can be used for statistical analysis.

NOTE: On 3/12/15 NVD changed the CVSS v2 access complicity from high to medium. As a result Qualys revised the CVSS score to 4.3 immediately. On 5/4/15 Qualys is also revising the severity to level 3.

IMPACT:

If this attack is carried out and an HTTP cookie is recovered, then the attacker can use the cookie to impersonate the user whose cookie was recovered.

This attack is not very practical as it requires the attacker to have access to millions of samples of ciphertext, but there are certain assumptions that an attacker can make to improve the chances of recovering the cleartext from ciphertext. For examples HTTP cookies are either base64 encoded or hex digits. This information can help the attacker in their efforts to recover the cookie.

SOLUTION:

RC4 should not be used where possible. One reason that RC4(Arcfour) was still being used was BEAST and Lucky13 attacks against CBC mode ciphers

in SSL and TLS. However, TLSv 1.2 or later address these issues.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 metasploit

3 SSLv3 Padding Oracle Attack Information Disclosure Vulnerability (POODLE)

port 5432/tcp over SSL

QID: 38603
Category: General remote services
Associated CVEs: [CVE-2014-3566](#)
Vendor Reference: [POODLE](#)
Bugtraq ID: 70574
Service Modified: 03/12/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The SSL protocol 3.0 design error, uses nondeterministic CBC padding, which makes it easier for man-in-the-middle attacks.

The target supports SSLv3, which makes it vulnerable to POODLE (Padding Oracle On Downgraded Legacy Encryption), even if it also supports more recent versions of TLS. It's subject to a downgrade attack, in which the attacker tricks the browser into connecting with SSLv3.

Please refer QID 38116 result as well, this QID will also report the list of SSLv3 ciphers support by server.

This QID is an automatic PCI FAIL in accordance with the PCI standards.

Further details can be found under:

PCI: ASV Program Guide v3.1 (page 27) (https://www.pcisecuritystandards.org/documents/ASV_Program_Guide_v3.1.pdf)

PCI: Use of SSL Early TLS and ASV Scans (<https://www.pcisecuritystandards.org/documents/Use-of-SSL-Early-TLS-and-ASV-Scans.pdf>)

IMPACT:

An attacker who can take a man-in-the-middle (MitM) position can exploit this vulnerability and gain access to encrypted communication between a client and server.

SOLUTION:

Disable SSLv3 support to avoid this vulnerability.

Examples to disable SSLv3.

nginx: list specific allowed protocols in the "ssl_protocols" line. Make sure SSLv2 and SSLv3 is not listed. For example: ssl_protocols TLSv2 TLSv1.1 TLSv1.2;

Apache: Add -SSLv3 to the "SSLProtocol" line.

How to disable SSL 3.0 on Microsoft IIS (<https://support.microsoft.com/kb/187498/en-us>).

For PCI, please refer to the Qualys community article (<https://community.qualys.com/thread/15280>).

 3 SSL Server Has SSLv3 Enabled Vulnerability

port 5432/tcp over SSL

QID: 38606
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 03/04/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

SSL 3.0 is an obsolete and insecure protocol.
Encryption in SSL 3.0 uses either the RC4 stream cipher, or a block cipher in CBC mode.
RC4 is known to have biases, and the block cipher in CBC mode is vulnerable to the POODLE attack.

The SSLv3 protocol is insecure due to the POODLE attack and the weakness of RC4 cipher.

Note: In April 2016, PCI released PCI DSS v3.2 (https://www.pcisecuritystandards.org/documents/PCI_DSS_v3-2.pdf) announcing that NIST no longer considers Secure Socket Layers (SSL) v3.0 protocol as acceptable for protecting data and that all versions of SSL versions do not meet the PCI definition of "strong cryptography."

This QID is an automatic PCI FAIL in accordance with the PCI standards.

Further details can be found under:

PCI: ASV Program Guide v3.1 (page 27) (https://www.pcisecuritystandards.org/documents/ASV_Program_Guide_v3.1.pdf)

PCI: Use of SSL Early TLS and ASV Scans (<https://www.pcisecuritystandards.org/documents/Use-of-SSL-Early-TLS-and-ASV-Scans.pdf>)

IMPACT:

An attacker can exploit this vulnerability to read secure communications or maliciously modify messages.

SOLUTION:

Disable the SSL 3.0 protocol in the client and in the server.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSLv3 is supported

3 Secure Sockets Layer/Transport Layer Security (SSL/TLS) Server supports Transport Layer Security (TLSv1.0)

port 5432/tcp over SSL

QID: 38628
Category: General remote services
Associated CVEs: -
Vendor Reference: [Deprecating TLS 1.0 and TLS 1.1](#)
Bugtraq ID: -
Service Modified: 12/23/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

TLS is capable of using a multitude of ciphers (algorithms) to create the public and private key pairs. For example if TLSv1.0 uses either the RC4 stream cipher, or a block cipher in CBC mode. RC4 is known to have biases and the block cipher in CBC mode is vulnerable to the POODLE attack.

TLSv1.0, if configured to use the same cipher suites as SSLv3, includes a means by which a TLS implementation can downgrade the connection to SSL v3.0, thus weakening security.

A POODLE-type (<https://blog.qualys.com/ssllabs/2014/12/08/poodle-bites-tls>) attack could also be launched directly at TLS without negotiating a downgrade.

This QID is an automatic PCI FAIL in accordance with the PCI standards.

Further details can be found under:

PCI: ASV Program Guide v3.1 (page 27) (https://www.pcisecuritystandards.org/documents/ASV_Program_Guide_v3.1.pdf)

PCI: Use of SSL Early TLS and ASV Scans (<https://www.pcisecuritystandards.org/documents/Use-of-SSL-Early-TLS-and-ASV-Scans.pdf>)

NOTE: On March 31, 2021 Transport Layer Security (TLS) versions 1.0 (RFC 2246) and 1.1 (RFC 4346) are formally deprecated. Refer to Deprecating TLS 1.0 and TLS 1.1 (<https://tools.ietf.org/html/rfc8996>)

IMPACT:

An attacker can exploit cryptographic flaws to conduct man-in-the-middle type attacks or to decryption communications.

For example: An attacker could force a downgrade from the TLS protocol to the older SSLv3.0 protocol and exploit the POODLE vulnerability, read secure communications or maliciously modify messages.

A POODLE-type (<https://blog.qualys.com/ssllabs/2014/12/08/poodle-bites-tls>) attack could also be launched directly at TLS without negotiating a downgrade.

SOLUTION:

Disable the use of TLSv1.0 protocol in favor of a cryptographically stronger protocol such as TLSv1.2. The following openssl commands can be used

to do a manual test:
openssl s_client -connect ip:port -tls1

If the test is successful, then the target support TLSv1

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

TLSv1.0 is supported

3 Birthday attacks against TLS ciphers with 64bit block size vulnerability (Sweet32)

port 5432/tcp over SSL

QID: 38657
Category: General remote services
Associated CVEs: [CVE-2016-2183](#)
Vendor Reference: -
Bugtraq ID: 92630,95568
Service Modified: 12/16/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Legacy block ciphers having block size of 64 bits are vulnerable to a practical collision attack when used in CBC mode. All versions of SSL/TLS

protocol support cipher suites which use DES, 3DES, IDEA or RC2 as the symmetric encryption cipher are affected.

Note: This CVE is patched at following

versions
OPENSSL-0.9.8J-0.102.2
LIBOPENSSL0_9_8-0.9.8J-0.102.2
LIBOPENSSL0_9_8-32BIT-0.9.8J-0.102.2
OPENSSL1-1.0.1G-0.52.1
OPENSSL1-DOC-1.0.1G-0.52.1
LIBOPENSSL1_0_0-1.0.1G-0.52.1
LIBOPENSSL1-DEVEL-1.0.1G-0.52.1
JAVA-1_6_0-IBM-1.6.0_SR16.41-81.1

IMPACT:

Remote attackers can obtain cleartext data via a birthday attack against a long-duration encrypted session.

SOLUTION:

Disable and stop using DES, 3DES, IDEA or RC2 ciphers.

More information can be found at Sweet32 (<https://sweet32.info/>), Microsoft Windows

TLS changes docs (<https://docs.microsoft.com/en-us/windows-server/security/tls/tls-schannel-ssp-changes-in-windows-10-and-windows-server>) and

2 Remote Login Service Open

QID: 38019
Category: General remote services
Associated CVEs: [CVE-1999-0651](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 12/12/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The login service is open. It's possible that this service is wrapped on your host. Wrapping provides a first level of security. If the service is wrapped, check that all hosts authorized by the TCP wrapper to connect to the rlogin service are secure. The security of your host depends on the security of hosts connecting to it.

IMPACT:

This can lead to severe problems since the rlogin service is vulnerable to both brute force and spoofing attacks.

SOLUTION:

Remove the rlogin service. If a remote connection is required on this host, install Secure Shell or France Secure Shell (fsh) in France. This is an appliance with crypto regulation. You can download Secure Shell from the SSH Web site (www.ssh.com) (<http://www.ssh.com/>).

If you cannot install one of these programs, then you should ensure that a TCP Wrapper is installed to restrict the hosts that can connect to this service.

Description: rexec Authentication Scanner

Link:

https://raw.githubusercontent.com/rapid7/metasploit-framework/master/modules/auxiliary/scanner/rservices/rexec_login.rb

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Detected service rlogin and os UNKNOWN

2 NetBIOS Name Accessible

QID:	70000
Category:	SMB / NETBIOS
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	04/28/2009
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Unauthorized users can obtain this host's NetBIOS server name from a remote system.

IMPACT:

Unauthorized users can obtain the list of NetBIOS servers on your network. This list outlines trust relationships between server and client computers. Unauthorized users can therefore use a vulnerable host to penetrate secure servers.

SOLUTION:

If the NetBIOS service is not required on this host, disable it. Otherwise, block any NetBIOS traffic at your network boundaries.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

0FAE9A50E134

2 Accessible Anonymous FTP Server

port 21/tcp

QID: 27000
Category: File Transfer Protocol
Associated CVEs: [CVE-1999-0497](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/07/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Users can access the FTP server using the "anonymous" or "ftp" account with any password. Some FTP server software is installed with Anonymous access enabled by default. Vulnerable systems include RedHat Linux installations and Microsoft IIS (Internet Information Server) installations.

IMPACT:

The FTP server may contain sensitive files because anonymous FTP servers are often used to exchange files between different users. These files can be downloaded by anybody who visits this FTP server. Anonymous FTP is often used for "bounce attacks". Bounce attacks enable unauthorized users to scan networks, hosts and ports behind a firewall. This can result in internal networks, VPN and Intranets being compromised.

SOLUTION:

You should first decide if you really require the FTP service on this host. If you use it to exchange files between users, you should either use a dedicated password-protected account, or, by default, an unreadable but writeable directory.

The security of this last option depends on the secrecy of the filenames you upload and download from this directory. Therefore, avoid guessable filenames like "backup", "accounting" or "project".

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 metasploit

Reference: CVE-1999-0497

Description: Anonymous FTP Access Detection

Link:

https://raw.githubusercontent.com/rapid7/metasploit-framework/master/modules/auxiliary/scanner/ftp/ftp_anonymous.rb

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

No results available

2 FTP users with Blank Password Allowed

port 21/tcp

QID: 27001
Category: File Transfer Protocol
Associated CVEs: [CVE-1999-0497](#)
Vendor Reference: -

Bugtraq ID: -
Service Modified: 05/07/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Users can access the FTP server with a blank password.

IMPACT:

Unauthorized users can view sensitive information, and, under specific circumstances, may be able to obtain remote shell access.

SOLUTION:

You should first decide if you really require the FTP service on this host. If you use it to exchange files between users, you should either use a dedicated password-protected account, or, by default, an unreadable but writable directory.

The security of this last option depends on the secrecy of the file names you upload and download from this directory. Therefore, avoid guessable file names like "backup", "accounting" or "project".

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

? metasploit

Reference: CVE-1999-0497

Description: Anonymous FTP Access Detection

Link:

https://raw.githubusercontent.com/rapid7/metasploit-framework/master/modules/auxiliary/scanner/ftp/ftp_anonymous.rb

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

anonymous <NO_PASSWORD>
ftp <NO_PASSWORD>

2 Directory /doc/ Listable

port 80/tcp

QID: 10859
Category: CGI
Associated CVEs: [CVE-1999-0678](#)
Vendor Reference: -
Bugtraq ID: 318
Service Modified: 05/02/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Listing of files in the /doc/ directory is allowed.

For example, a default configuration of Apache on Debian Linux sets the ServerRoot to /usr/doc, which allows remote users to read documentation files for the entire server.

IMPACT:

By browsing the doc directory, unauthorized users can obtain a list of all files present on the directory and some hints about the packages

installed on the server. This may assist in further attacks against the host.

SOLUTION:

Set a more restrictive rule on your server to prevent directory listing of the doc directory.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

The Exploit-DB

2 Web Directories Listable Vulnerability

port 80/tcp

QID:	86445
Category:	Web server
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	04/17/2019
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

The Web server has some listable directories. Very sensitive information can be obtained from directory listings.

IMPACT:

A remote user may exploit this vulnerability to obtain very sensitive information on the host. The information obtained may assist in further attacks against the host.

SOLUTION:

Disable directory browsing or listing for all directories.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Listable Directories

/doc/

/icons/

2 SSH Server Public Key Too Small

port 22/tcp

QID: 38738
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/03/2019
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another.

The SSH Server is using a small Public Key.

Best practices require that RSA digital signatures be 2048 or more bits long to provide adequate security. Key lengths of 1024 are acceptable through 2013, but since 2011 they are considered deprecated.

For more information, please refer to NIST Special Publication 800-131A (<http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-131Ar1.pdf> (<http://nvlpubs.nist.gov/nistpubs/SpecialPublications/NIST.SP.800-131Ar1.pdf>)).

Only server keys that are not part of a certificate are reported in this QID. OpenSSH certificates using short keys are reported in QID 38733. X.509 certificates using short keys are reported in QID 38171.

IMPACT:

A man-in-the-middle attacker can exploit this vulnerability to record the communication to decrypt the session key and even the messages.

SOLUTION:

DSA keys and RSA keys shorter than 2048 bits are considered vulnerable. It is recommended to install a RSA public key length of at least 2048 bits or greater, or to switch to ECDSA or EdDSA.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Algorithm	Length
ssh-dss	1024 bits

QID: 38909
 Category: General remote services
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 09/05/2025
 User Modified: -
 Edited: No
 PCI Vuln: No

THREAT:

The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another. The target is using deprecated SHA1 cryptographic settings to communicate.

IMPACT:

vulnerable to collision attacks, which are designed to fabricate the same hash value for different input data. each hash is supposedly unique.

SOLUTION:

Avoid using deprecated cryptographic settings.

Use best practices when configuring SSH.

Refer to NIST Retires SHA-1 Cryptographic Algorithm (SSH)
 (<https://www.nist.gov/news-events/news/2022/12/nist-retires-sha-1-cryptographic-algorithm>) .

Other documents to refer

Deprecate settings listed for red hat

(https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html/7.4_release_notes/chap-red_hat_enterprise_linux-7.4_release_note_s-deprecated_functionality_in_rhel7)

Key exchange (<https://www.ietf.org/archive/id/draft-ietf-curdle-ssh-kex-sha2-13.html>)

CBC Cipher (<https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5161>)

Settings currently considered deprecated:

1.Key exchange algorithms:

diffie-hellman-group1-sha1, rsa1024sha1, diffie-hellman-group14-sha1, diffie-hellman-group-exchange-sha1, gss-gex-sha1-*, gss-group1-sha1-* and gss-group14-sha1-*.

2.MAC:

hmac-sha1, hmac-sha1-96, hmac-sha1-etm@openssh.com, hmac-sha1-96-etm@openssh.com

3.Host key:

ssh-rsa, ssh-dss, ssh-rsa-cert-v01@openssh.com, ssh-dss-cert-v01@openssh.com

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Type	Name
key exchange	diffie-hellman-group-exchange-sha1
key exchange	diffie-hellman-group14-sha1
key exchange	diffie-hellman-group1-sha1
host key algorithm	ssh-rsa
host key algorithm	ssh-dss

MAC	hmac-sha1
MAC	hmac-sha1-96

2 SSL Certificate - Expired

port 5432/tcp over SSL

QID: 38167
 Category: General remote services
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 02/03/2025
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

An SSL Certificate associates an entity (person, organization, host, etc.) with a Public Key. In an SSL connection, the client authenticates the remote server using the server's Certificate and extracts the Public Key in the Certificate to establish the secure connection.

A certificate with a past end date cannot be trusted.

IMPACT:

By exploiting this vulnerability, an attacker can launch a man-in-the-middle attack.

SOLUTION:

Please install a server certificate with valid start and end dates.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Certificate #0
 emailAddress=root@ubuntu804-base.localdomain,CN=ubuntu804-base.localdomain,OU=Office_for_Complication_of_Otherwise_Simple_Affairs,O=OCO
 SA,L=Everywhere,ST=There_is_no_such_thing_outside_US,C=XX is not valid after Apr 16 14:07:45 2010 GMT.

2 SSL Certificate - Self-Signed Certificate

port 5432/tcp over SSL

QID: 38169
 Category: General remote services
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 11/23/2020
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

An SSL Certificate associates an entity (person, organization, host, etc.) with a Public Key. In an SSL connection, the client authenticates the remote

server using the server's Certificate and extracts the Public Key in the Certificate to establish the secure connection.

The client can trust that the Server Certificate belongs to the server only if it is signed by a mutually trusted third-party Certificate Authority (CA). Self-signed certificates are created generally for testing purposes or to avoid paying third-party CAs. These should not be used on any production or critical servers.

By exploiting this vulnerability, an attacker can impersonate the server by presenting a fake self-signed certificate. If the client knows that the server does not have a trusted certificate, it will accept this spoofed certificate and communicate with the remote server.

IMPACT:

By exploiting this vulnerability, an attacker can launch a man-in-the-middle attack.

SOLUTION:

Please install a server certificate signed by a trusted third-party Certificate Authority.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Certificate #0
emailAddress=root@ubuntu804-base.localdomain,CN=ubuntu804-base.localdomain,OU=Office_for_Complication_of_Otherwise_Simple_Affairs,O=OCOSA,L=Everywhere,ST=There_is_no_such_thing_outside_US,C=XX is a self signed certificate.

2 SSL Certificate - Subject Common Name Does Not Match Server FQDN

port 5432/tcp over SSL

QID:	38170
Category:	General remote services
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	08/05/2025
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

An SSL Certificate associates an entity (person, organization, host, etc.) with a Public Key. In an SSL connection, the client authenticates the remote server using the server's Certificate and extracts the Public Key in the Certificate to establish the secure connection.

A certificate whose Subject commonName or subjectAltName does not match the server FQDN offers only encryption without authentication.

Please note that a false positive reporting of this vulnerability is possible in the following case:

If the common name of the certificate uses a wildcard such as *.somedomainname.com and the reverse DNS resolution of the target IP is not configured. In this case there is no way for Qualys to associate the wildcard common name to the IP. Adding a reverse DNS lookup entry to the target IP will solve this problem.

IMPACT:

A man-in-the-middle attacker can exploit this vulnerability in tandem with a DNS cache poisoning attack to lure the client to another server, and then steal all the encryption communication.

SOLUTION:

Please install a server certificate whose Subject commonName or subjectAltName matches the server FQDN.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Certificate #0

emailAddress=root@ubuntu804-base.localdomain,CN=ubuntu804-base.localdomain,OU=Office_for_Complication_of_Otherwise_Simple_Affairs,O=OCO
SA,L=Everywhere,ST=There_is_no_such_thing_outside_US,C=XX (ubuntu804-base.localdomain) doesn't resolve

2 SSL Certificate - Signature Verification Failed Vulnerability

port 5432/tcp over SSL

QID: 38173
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/17/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

An SSL Certificate associates an entity with a Public Key and is used by clients to authenticate the server during an SSL/TLS connection. This authentication relies on verifying that the certificate is signed by a trusted Certificate Authority (CA).

If certificate verification fails, the client cannot reliably authenticate the server and may abort the connection or proceed without validation.

Verification failure may occur due to reasons such as a self-signed certificate, untrusted CA, missing intermediate certificates, expired or invalid certificates, mismatched issuer information, unsupported signature algorithms, or signature validation errors.

This may allow an attacker to perform man-in-the-middle attacks and compromise the confidentiality and integrity of the communication.

IMPACT:

By exploiting this vulnerability, man-in-the-middle attacks in tandem with DNS cache poisoning can occur.

Exception:

If the server communicates only with a restricted set of clients who have the server certificate or the trusted CA certificate, then the server or CA certificate may not be available publicly, and the scan will be unable to verify the signature.

SOLUTION:

Ensure the SSL certificate is valid and trusted. Install a certificate signed by a trusted Certificate Authority and configure the complete certificate chain, including any required intermediate certificates. Replace expired or invalid certificates and ensure proper issuer and signature configuration

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Certificate #0

emailAddress=root@ubuntu804-base.localdomain,CN=ubuntu804-base.localdomain,OU=Office_for_Complication_of_Otherwise_Simple_Affairs,O=OC

2 X.509 Certificate SHA1 Signature Collision Vulnerability

port 5432/tcp over SSL

QID: 38655
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 10/25/2018
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Hash algorithms are used to generate a hash value for a message (an arbitrary block of data) such that a number of cryptographic properties hold. In particular it is expected to be resistant to collisions, that is that given a message m , it is difficult to compute a second message m' such that both have the same hash value.

Hash algorithms are used in many cryptographic applications. In particular, they are used in order to sign X.509 certificates used to verify identity in a variety of applications, including SSL communications.

SHA1 has been deprecated for certificate signatures. In 2017, all browsers will stop trusting web sites that continue to use this weak hash function for signatures.

IMPACT:

An attacker may create a pair of X.509 certificates with differing information which share the same signature. If one of the certificates is signed, the signature may be used for the second certificate as well. It is possible to exploit this issue to gain a signed certificate for an identity the attacker does not control, or to gain a signed certificate as an intermediary signing authority. In the second case, the attacker will be able to sign additional, arbitrary certificates which will be trusted by any party trusting the original, legitimate authority.

An attacker is most likely to exploit this issue to conduct phishing attacks or to impersonate legitimate Web sites by taking advantage of malicious certificates. Other attacks are likely to be possible.

SOLUTION:

Workaround: If the certificate is signed using SHA1 hash function then a new certificate should be obtained which uses a more collision proof hashing algorithm such as SHA-256

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

1 Expose_php Set to On in php.ini

port 80/tcp

QID: 12087
Category: CGI
Associated CVEs: -

Vendor Reference: -
Bugtraq ID: -
Service Modified: 04/23/2009
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The scanner found PHP version information in the headers returned by the PHP-enabled target Web server. This likely means that the "expose_php" variable is set to "On" in the "php.ini" configuration file for the Web server.

IMPACT:

This allows remote users to easily know that PHP is installed on the Web server. It also provides version information of the PHP installation. This could aid an attacker in launching more targeted attacks in the future.

SOLUTION:

Locate the "php.ini" configuration file on the target host and add this setting to it: "expose_php=Off". Restart the Web server.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

Potential Vulnerabilities (151)

5 OpenSSH Remote Code Execution (RCE) Vulnerability in its forwarded ssh-agent

QID: 38904
 Category: General remote services
 Associated CVEs: [CVE-2023-38408](#)
 Vendor Reference: [OpenSSH 9.3p2](#)
 Bugtraq ID: -
 Service Modified: 04/23/2026
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

We have discovered this vulnerability (CVE-2023-38408) - It is a condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket if the conditions mentioned here (<https://www.openssh.com/txt/release-9.3p2>) are met.

Affected Versions:
 OpenSSH versions prior to 9.3p2

IMPACT:

Successful exploitation allows an attacker to perform a remote code execution vulnerability via a forwarded agent socket.

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.3p2 (<https://www.openssh.com/txt/release-9.3p2>) or later to remediate these vulnerabilities.

Patch:
 Following are links for downloading patches to fix the vulnerabilities:
 OpenSSH 9.3p2 (<https://www.openssh.com/txt/release-9.3p2>)

COMPLIANCE:

RESULTS:

Vulnerable SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

5 OpenSSH Improper Failed Cookie Generation Handling Vulnerability (CVE-2016-1908)

QID: 38906
Category: General remote services
Associated CVEs: [CVE-2016-1908](#)
Vendor Reference: [OpenSSH 7.2](#)
Bugtraq ID: -
Service Modified: 12/25/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Mishandling of failed cookie generation for untrusted X11 forwarding and relies on the local X11 server for access-control decisions, which allows remote X11 clients to trigger a fallback and obtain trusted X11 forwarding privileges by leveraging configuration issues on this X11 server.

Affected Versions:
OpenSSH versions prior to 7.2

IMPACT:

Successful exploitation allows a remote attacker to obtain trusted X11 forwarding privileges by leveraging configuration issues on this X11 server resulting in considerable informational disclosure, Modification of some system files or information is possible, and reduced performance or interruptions in resource availability.

SOLUTION:

Customers are advised to upgrade to OpenSSH 7.2 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

OpenSSH 7.2 (<https://www.openssh.com/txt/release-7.2>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

5 Samba Remote Code Execution Vulnerability

QID: 70064
Category: SMB / NETBIOS
Associated CVEs: [CVE-2012-1182](#)
Vendor Reference: [Samba Security Advisory](#)

Bugtraq ID: -
Service Modified: 08/15/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a freely available file and printer sharing application. Samba allows users to share files and printers between operating systems on UNIX and Windows platforms.

The code generator for Samba's remote procedure call (RPC) code contained an error which caused it to generate code containing a security flaw. This generated code is used in the parts of Samba that control marshalling and unmarshalling of RPC calls over the network.

Affected Versions:
Samba versions 3.6.3 and all previous versions.

IMPACT:

If this vulnerability is successfully exploited, attackers can execute arbitrary code as the "root" user.

SOLUTION:

The vendor has released patches as well as a new version (Samba 3.6.4, Samba 3.5.14 and 3.4.16) to resolve this issue. Refer to Samba Advisory for CVE-2012-1182 (<https://www.samba.org/samba/security/CVE-2012-1182>) to obtain additional details about this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba 3.4.16. (Samba) (<http://ftp.samba.org/pub/samba/samba-3.4.16.tar.gz>)

Samba 3.6.4 (Samba) (<http://ftp.samba.org/pub/samba/samba-3.6.4.tar.gz>)

Samba 3.5.14 (Samba) (<http://ftp.samba.org/pub/samba/samba-3.5.14.tar.gz>)

https://raw.githubusercontent.com/rapid7/metasploit-framework/master/modules/exploits/linux/samba/setinfopolicy_heap.rb

coreimpact

Reference: CVE-2012-1182

Description: Samba LsarSetInformationPolicy Request Remote Buffer Overflow Exploit Update 2

Link: <https://www.coresecurity.com/core-labs/exploits>

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Samba 3.0.20-Debian

5 EOL/Obsolete Operating System: Ubuntu 8.04 Detected

QID: 105604

Category: Security Policy

Associated CVEs: -

Vendor Reference: [Ubuntu 8.04 \(Desktop\) End of Life](#), [Ubuntu 8.04 \(Server\) End of Life](#)

Bugtraq ID: -

Service Modified: 04/07/2016

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

The host is running Ubuntu 8.04. Support for Ubuntu 8.04 (Desktop) ended on May 12, 2011 and Ubuntu 8.04 (Server) on May 9, 2013. No further updates, including security updates are available for Ubuntu 8.04.

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

Update to the latest version of Ubuntu Operating System.
Refer to Ubuntu (<http://www.ubuntu.com/>) for information on this operating system.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

EOL/Obsolete Operating System: Ubuntu 8.04 detected on port 22 - SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1

5 EOL/Obsolete Software: Samba 3.x Detected

QID:	105666
Category:	Security Policy
Associated CVEs:	-
Vendor Reference:	Samba Release Planning
Bugtraq ID:	-
Service Modified:	09/06/2023
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Samba 3.x was detected on the host.

Technical support for Samba 3.x has ended. No further bug fixes, enhancements, security updates or technical support is available for this release.

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

Update to the latest service pack or a currently supported service pack.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Samba 3.0.20-Debian

5 EOL/Obsolete Software: Apache HTTP Server 2.2.x Detected

QID: 105728
Category: Security Policy
Associated CVEs: -
Vendor Reference: [Apache httpd 2.2.34](#)
Bugtraq ID: 43673,40827,49303,49616,49957,19661,20527,25653,50494,51407,51706,26838,55131,58165,64758,27237,27236,21
Service Modified: 05/23/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Apache Software Foundation and the Apache HTTP Server Project announced that the Apache HTTP Server 2.2.x reached End-of-Life status as no further 2.2 releases are anticipated.

Apache HTTP Server 2.2.x is detected on the host.

IMPACT:

The system is at high risk of being exposed to security vulnerabilities because the vendor no longer provides updates.

SOLUTION:

Upgrade a supported version of Apache HTTP Server. Supported versions can be found at Apache HTTP Server Project (<http://httpd.apache.org/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

5 Apache httpd Server Uninitialized memory reflection in mod_auth_digest Information Disclosure Vulnerability

port 80/tcp

QID: 87555
Category: Web server
Associated CVEs: [CVE-2017-9788](#)
Vendor Reference: [Apache HTTP Server Security Advisory](#)
Bugtraq ID: -
Service Modified: 09/23/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache Web Server is an open-source web server.

Uninitialized memory reflection in mod_auth_digest leading to leakage of potentially confidential information, and a segfault.

Affected Versions:

Apache httpd 2.2.x before 2.2.34

Apache httpd 2.4.x before 2.4.27

IMPACT:

Successful exploitation of this vulnerability may allow an attacker to make the targeted server unavailable and cause denial of service.

SOLUTION:

Customers are advised to upgrade to Apache httpd 2.2.34, 2.4.27 (<https://httpd.apache.org/download.cgi>) or later versions to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

5	Apache Hypertext Transfer Protocol Server (HTTP Server) Multiple Security Vulnerabilities (CVE-2022-28330, CVE-2022-28614, CVE-2022-28615, CVE-2022-29404, CVE-2022-30556)	port 80/tcp
QID:	731514	
Category:	CGI	
Associated CVEs:	CVE-2022-28330 , CVE-2022-28614 , CVE-2022-28615 , CVE-2022-29404 , CVE-2022-30556	
Vendor Reference:	Apache_http_server	
Bugtraq ID:	-	
Service Modified:	08/20/2024	
User Modified:	-	
Edited:	No	
PCI Vuln:	Yes	

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.

CVE-2022-28614: The `ap_rwrite()` function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using `ap_rwrite()` or `ap_rputs()`, such as with `mod_lua`'s `r:puts()` function.

CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in `ap_strcmp_match()` when provided with an extremely large input buffer.

CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls `r:parsebody(0)` may cause a denial of service due to no default limit on possible input size.

Vendor Reference: [MySQL 5.0](#)
Bugtraq ID: -
Service Modified: 09/06/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

MySQL version 5.0 is detected on the host.

Product Support for MySQL 5.0 ended on Jan 09, 2012. No further bug fixes, enhancements, security updates or technical support is available for this release.

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

Upgrade to the latest version of MySQL.

COMPLIANCE:

Not Applicable

5.0.51a-3ubuntu5

4 PHP Update 5.2.6 Not Installed

QID: 12258
Category: CGI
Associated CVEs: [CVE-2008-0599](#), [CVE-2008-2050](#), [CVE-2008-2051](#), [CVE-2008-2107](#), [CVE-2008-2108](#)
Vendor Reference: [PHP 5.2.6](#)
Bugtraq ID: 29009
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is exposed to the following vulnerabilities.

- 1) An unspecified error in the FastCGI SAPI can be exploited to cause a stack-based buffer overflow.
- 2) An error in the processing of multibyte characters within the "escapeshellcmd()" and "escapeshellarg()" functions can be exploited to escape the inserted backslash or quote characters via certain multibyte characters.
- 3) A vulnerability is caused due to an error during path translation in cgi_main.c.
- 4) An error in cURL can be exploited to bypass the "safe_mode" directive.
- 5) A boundary error in PCRE can potentially be exploited by malicious people to cause a denial of service or compromise a vulnerable system.

IMPACT:

These vulnerabilities can be exploited by malicious users to bypass certain security restrictions, and potentially to cause a denial of service or to compromise a vulnerable system.

SOLUTION:

Update to PHP Version 5.2.6. Refer to this PHP 5.2.6 Web site (<http://www.php.net/downloads.php>) for patch details.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

Reference: CVE-2008-2050

Description: Stack-based buffer overflow in the FastCGI SAPI (fastcgi.c) in PHP before 5.2.6 has unknown impact and attack vectors.

4 PHP "spl_object_storage_attach" Use-After-Free Vulnerability

Scan Results

PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for Web development and can be embedded in HTML.

PHP is prone to a vulnerability that is caused by a use-after-free error within the "spl_object_storage_attach()" function, which can be exploited by inserting the same object twice.

Affected Versions:

PHP 5.2 <= 5.2.13

PHP 5.3 <= 5.3.2

IMPACT:

If this vulnerability is successfully exploited, attackers can get potentially sensitive information and compromise a vulnerable system.

SOLUTION:

The vendor has released PHP Version 5.3.3 and 5.2.14 to address these issues. It is available for download from the PHP Download Web site (<http://www.php.net/downloads.php/>).

Refer to PHP 5.2.14 Change Log (<http://www.php.net/ChangeLog-5.php#5.2.14>) and PHP 5.3.3 Change Log (<http://www.php.net/ChangeLog-5.php#5.3.3>) to obtain additional details about the issues fixed in the update.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.2.14, PHP 5.3.3 (PHP) (<http://www.php.net/downloads.php/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

4 OpenSSH Multiple Vulnerabilities

QID: 38679
Category: General remote services
Associated CVEs: [CVE-2015-5600](#), [CVE-2015-6563](#), [CVE-2015-6564](#)
Vendor Reference: [OPENSSSH 7.0](#)
Bugtraq ID: 75990,91787,92012,76317
Service Modified: 05/28/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Multiple Vulnerabilities have been reported in OpenSSH.

- The `kbdint_next_device` function in `auth2-chall.c` in `sshd` in OpenSSH through 6.9 does not properly restrict the processing of keyboard-interactive devices within a single connection. (CVE-2015-5600)
- The monitor component in `sshd` in OpenSSH before 7.0 on non-OpenBSD platforms accepts extraneous username data in `MONITOR_REQ_PAM_INIT_CTX` requests. (CVE-2015-6563)
- Use-after-free vulnerability in the `mm_answer_pam_free_ctx` function in `monitor.c` in `sshd` in OpenSSH before 7.0 on non-OpenBSD platforms might allow local users to gain privileges. (CVE-2015-6564)

IMPACT:

Remote attackers could conduct brute-force attacks or cause a denial of service (CPU consumption).

SOLUTION:

OpenSSH 7.0 has been released to address this issue.

Update to the latest supported version of OpenSSH.
Check the OpenSSH 7.0 (<http://www.openssh.com/txt/release-7.0>) for further information.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

OPENSSSH 7.0: OpenSSH (<http://www.openssh.com/txt/release-7.0>)

COMPLIANCE:

User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Multiple Vulnerabilities have been reported in OpenSSH v7.3 and earlier. These vulnerabilities if exploited will allow code execution, privilege escalation, information disclosure and denial of service attacks.

IMPACT:

Successful exploitation of the vulnerabilities will lead to code execution, privilege escalation, information disclosure and denial of service attacks.

SOLUTION:

OpenSSH 7.4 has been released to address this issue.

Update to the latest supported version of OpenSSH.

Check the OpenSSH 7.4 release notes page (<http://www.openssh.com/txt/release-7.4>) for further information.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

4 Samba Out-Of-Bounds Heap Read/Write Vulnerability

QID: 38857
Category: General remote services
Associated CVEs: [CVE-2021-44142](#)
Vendor Reference: [Samba Security Advisory](#)
Bugtraq ID: -
Service Modified: 03/12/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

All versions of Samba prior to 4.13.17 are vulnerable to an out-of-bounds heap read write vulnerability that allows remote attackers to execute arbitrary code as root on affected Samba installations that use the VFS module vfs_fruit. The problem in vfs_fruit exists in the default configuration of the fruit VFS module using fruit:metadata=netatalk or fruit:resource=file. If both options are set to different settings than the default values, the system is not affected by the security issue.

Affected Versions:
All versions of Samba prior to 4.13.17 are vulnerable

IMPACT:

Successful exploitation of the vulnerability may allow a remote attacker to execute arbitrary code as root user on affected Samba installations.

SOLUTION:

Customers are advised to update to Samba Version 4.13.17, 4.14.12, 4.15.5 or later to patch the vulnerability. For more information please refer to the following Samba Security Advisory (<https://www.samba.org/samba/security/CVE-2021-44142.html>) Workaround: As a workaround remove the "fruit" VFS module from the list of configured VFS objects in any "vfs objects" line in the Samba configuration smb.conf. Note that changing the VFS module settings fruit:metadata or fruit:resource to use the unaffected setting causes all stored information to be inaccessible and will make it appear to macOS clients as if the information is lost.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
NA (<https://www.samba.org/samba/security/CVE-2021-44142.html>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 nvd

Reference: CVE-2021-44142

Description: The Samba vfs_fruit module uses extended file attributes (EA, xattr) to provide "...enhanced compatibility with Apple SMB clients and interoperability with a Netatalk 3 AFP fileserver." Samba versions prior to 4.13.17, 4.14.12 and 4.15.5 with vfs_fruit configured allow out-of-bounds heap read and write via specially crafted extended file attributes. A remote attacker with write access to extended file attributes can execute arbitrary code with the privileges of smbd, typically root.

4 OpenSSH Authentication Bypass Vulnerability

QID: 38919
Category: General remote services
Associated CVEs: [CVE-2023-51767](#)
Vendor Reference: [OpenSSH 9.6](#)
Bugtraq ID: -
Service Modified: 04/27/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:

OpenSSH up to version through 10.0

IMPACT:

Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.

SOLUTION:

There are no vendor supplied patches available at this time.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

4 OpenSSH Improper Restriction of Operations Vulnerability

QID: 38950
Category: General remote services
Associated CVEs: [CVE-2014-1692](#)
Vendor Reference: [OpenSSH 6.5](#)
Bugtraq ID: -
Service Modified: 05/29/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:

OpenSSH before version 6.5

IMPACT:

Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.

SOLUTION:

Customers are advised to upgrade to OpenSSH 6.5 (<https://www.openssh.com/txt/release-6.5>) or later to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

OpenSSH 6.5 (<https://www.openssh.com/txt/release-6.5>)

4 Samba NMBD Logon Request Remote Buffer Overflow Vulnerability

QID: 70046
Category: SMB / NETBIOS
Associated CVEs: [CVE-2007-4572](#)
Vendor Reference: -
Bugtraq ID: 26454
Service Modified: 08/03/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a suite of software that provides file and print services for "SMB/CIFS" clients. It is available for multiple platforms.

Samba is prone to a buffer overflow vulnerability because it fails to perform adequate boundary checks on user-supplied data. Specifically, this issue affects "nmbd" when processing a specially crafted "GETDC" logon server request.

Samba Versions 3.0.0 through 3.0.26a are vulnerable.

IMPACT:

Attackers can exploit this issue to cause denial of service conditions. Due to the nature of this issue, remote code execution may be possible.

SOLUTION:

Workaround: The vendor states that disabling the "domain logons" and "domain master" options in the "smb.conf" file will negate this issue. However, this will also disable all domain controller features.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

HPSBUX02341 (http://www11.itrc.hp.com/service/cki/docDisplay.do?docLocale=en&docId=emr_na-c01475657-1)

RESULTS:

Samba 3.0.20-Debian

4 Samba chain_reply() Memory Corruption Vulnerability

QID: 70058
Category: SMB / NETBIOS
Associated CVEs: [CVE-2010-2063](#)
Vendor Reference: [Samba 3.3.13 Release Notes](#)
Bugtraq ID: 40884
Service Modified: 08/15/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a freely available file and printer sharing application maintained and developed by the Samba Development Team. Samba allows users to share files and printers between operating systems on UNIX and Windows platforms.

Samba is prone to a vulnerability in Samba's chain_reply() function, where an attacker could trigger a memory corruption by sending specially crafted SMB requests resulting in heap memory overwritten with attacker-supplied data, which can allow attackers to execute code remotely.

Samba Versions 3.0.x to 3.3.12 are vulnerable.

Note: Previously, this was an iDefense exclusive vulnerability with iDefense ID: 595299

IMPACT:

An attacker can exploit these issues to execute arbitrary code with root privileges.

SOLUTION:

The vendor has released patches as well as a new version (Samba 3.3.13) to resolve this issue. Refer to Samba Advisory for CVE-2010-2063 (<http://www.samba.org/samba/security/CVE-2010-2063>) to obtain additional details about this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

4 Samba Multiple Vulnerabilities

QID: 70070
Category: SMB / NETBIOS
Associated CVEs: [CVE-2013-4408](#), [CVE-2012-6150](#)
Vendor Reference: [CVE-2013-4408](#), [CVE-2012-6150](#)
Bugtraq ID: 64191
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a re-implementation of the SMB/CIFS networking protocol that provides file and print services for various operating systems.

Samba is vulnerable to buffer overrun exploits while processing of DCE-RPC packets due to incorrect checking of the DCE-RPC fragment length

which can lead to remote code execution issue.

The winbind_name_list_to_sid_string_list function in nsswitch/pam_winbind.c in Samba accepts authentication by any user, which allows remote authenticated users to bypass intended access restrictions.

Affected Software:

Samba 3.x before 3.6.22
Samba 4.0.x before 4.0.13
Samba 4.1.x before 4.1.3

IMPACT:

Successful exploitation of these issue can allow an attacker to execute arbitrary code or bypass access restrictions.

SOLUTION:

Refer to Samba Advisory: CVE-2013-4408 (<http://www.samba.org/samba/security/CVE-2013-4408>) and Samba Advisory: CVE-2012-6150 (<http://www.samba.org/samba/security/CVE-2012-6150>) for more details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba 3.0.20-Debian

4 Apache HTTP Server Prior to 2.2.15 Multiple Vulnerabilities

QID:

86873

Category: Web server
Associated CVEs: [CVE-2010-0408](#), [CVE-2010-0425](#), [CVE-2010-0434](#)
Vendor Reference: [Apache 2.2.15](#)
Bugtraq ID: 38491,38494
Service Modified: 09/02/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Apache HTTP Server is a freely-available Web server.

Apache HTTP Server is exposed to following vulnerabilities:

- 1) The "ap_proxy_ajp_request()" function in modules/proxy/mod_proxy_ajp.c of the mod_proxy_ajp module returns the "HTTP_INTERNAL_SERVER_ERROR" error code when processing certain malformed requests. This can be exploited to put the backend server into an error state until the retry timeout expired by sending specially crafted requests.
- 2) When triggered, the mod_isapi module will unload the selected ISAPI module before the request processing is completed. This results in an orphaned callback pointer (also known as a dangling pointer). This vulnerability (CVE-2010-0425) affects Microsoft Windows based hosts only.
- 3) An error exists within the header handling when processing subrequests, which can lead to sensitive information from a request being handled by the wrong thread if a multi-threaded Multi-Processing Module (MPM) is used.

IMPACT:

Successfully exploiting these issues might allow a remote attacker exposure to sensitive information or cause denial of service.

SOLUTION:

Update to version 2.2.15 to resolve this issue. Refer to Apache Revision 917870 (<http://svn.apache.org/viewvc?view=revision&revision=917870>) and Apache Revision 917875 (<http://svn.apache.org/viewvc?view=revision&revision=917875>) to obtain additional patch details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP 2.2.15: Apache (917870)

4 Apache httpd Server Information Disclosure Vulnerability (OptionsBleed)

QID:	87310
Category:	Web server
Associated CVEs:	CVE-2017-9798
Vendor Reference:	Apache httpd 2.4.28
Bugtraq ID:	100872,105598
Service Modified:	03/12/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache Web Server is an open-source web server.

On systems with the Limit directive set within a '.htaccess' file and set to an invalid HTTP method, a remote user can send a specially crafted HTTP OPTIONS request for a path to trigger a use-after-free memory error and view potentially sensitive information from process memory on the target system.

This vulnerability is referred to as "Optionsbleed".

Apache HTTP Server through 2.2.34 and 2.4.x through 2.4.27

IMPACT:

A remote user can obtain potentially sensitive information on the target system in certain cases.

SOLUTION:

The Apache HTTP Project released patch version (2.4.28) to resolve this issue.
Refer to Apache security advisory CVE-2017-9798. (https://httpd.apache.org/security/vulnerabilities_24.html)
If you are using a Linux distribution, please refer to your Linux vendor for further information and updates.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

4 Apache HTTP Server mod_mime Buffer Overread

QID: 89009
Category: Web server
Associated CVEs: [CVE-2017-7679](#)
Vendor Reference: [Apache httpd 2.4.26](#), [Apache httpd 2.2.34](#)
Bugtraq ID: 99170
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Apache Module mod_mime is used to assign content metadata to the content selected for an HTTP response by mapping patterns in the URI or filenames to the metadata values.

In Apache httpd 2.2.x before 2.2.33 and 2.4.x before 2.4.26, mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

IMPACT:

A remote attacker could exploit this vulnerability to read one byte past the end of a buffer which could affect the confidentiality, integrity and availability of data on the target system.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to [Apache httpd 2.4.27 Changelog](#) (https://httpd.apache.org/security/vulnerabilities_24.html), [Apache httpd 2.2.34 Changelog](#) (https://httpd.apache.org/security/vulnerabilities_22.html), or your Linux distro for further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

CVE-2017-7679: Apache 2.2.x (https://httpd.apache.org/security/vulnerabilities_22.html)

CVE-2017-7679: Apache 2.4.x (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is prone to multiple buffer overflow vulnerabilities.

The system is vulnerable to the following issues:

- A buffer overflow in the imageloadfont function in ext/gd/gd.c (CVE-2008-3658)
- A buffer overflow inside memnstr function (CVE-2008-3659)
- Multiple directory traversal vulnerabilities (CVE-2008-2665, CVE-2008-2666)
- A denial of service when multiple dots preceding the extension (CVE-2008-3660)
- An IMAP toolkit crash: rfc822.c legacy routine buffer overflow (CVE-2008-2829)
- Allows attackers to bypass safe_mode restrictions (CVE-2008-5624)
- Allows attackers to write to arbitrary files by placing a 'php_value error_log' entry in a .htaccess file. (CVE-2008-5625)

PHP 4.x Versions prior to PHP 4.4.9 and PHP 5.x versions prior to 5.2.8 are vulnerable.

IMPACT:

Exploiting this vulnerability may result in a compromise of the underlying system. Failed attempts may lead to denial of service.

SOLUTION:

Refer to PHP 4.4.9 (<http://www.php.net/archive/2008.php#id2008-08-07-1>), PHP 5.2.8 (<http://www.php.net/ChangeLog-5.php#5.2.8>) for further details

on these vulnerabilities and patch instructions.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

PHP Versions prior to 5.5.38, 5.6.24 or 7.0.9 detected on port 80 over TCP.

4 PHP "rfc822_write_address()" Function Buffer Overflow Vulnerability

port 80/tcp

QID: 12254
Category: CGI
Associated CVEs: [CVE-2008-2829](#)
Vendor Reference: [Php 5.2.7](#)

Bugtraq ID:	29829
Service Modified:	05/12/2023
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

PHP is prone to a buffer overflow vulnerability because it fails to perform boundary checks before copying user-supplied data to insufficiently sized memory buffers.

php_imap.c in PHP 5.2.5, 5.2.6, 4.x, and other versions, uses obsolete API calls that allow context-dependent attackers to cause a denial of service (crash) and possibly execute arbitrary code via a long IMAP request, which triggers an "rfc822.c legacy routine buffer overflow" error message, related to the rfc822_write_address function.(CVE-2008-2829).

Php version 5.2.6 and earlier are affected by this issue.

IMPACT:

Exploitation of this issue may allow an attacker to execute arbitrary machine code in the context of the affected Web server. Failed attempts will likely cause a denial of service condition on the Web server.

SOLUTION:

The vendor has released PHP Version 5.2.7 to address these issues. It is available for download from the PHP Download Web site (<http://www.php.net/downloads.php>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.2.7 (PHP 5.2.7) (<http://www.php.net/downloads.php/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Date: Thu, 23 Jul 2026 07:20:58 GMT
Server: Apache/2.2.8 (Ubuntu) DAV/2

4 PHP ZipArchive::extractTo() ".zip" Files Directory Traversal Vulnerability

```
port 80/tcp
```

QID:	12267
Category:	CGI
Associated CVEs:	CVE-2008-5658
Vendor Reference:	-
Bugtraq ID:	32625
Service Modified:	02/29/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

PHP is an open-source scripting language used for Web development.

The application is prone to a directory traversal vulnerability because the application fails to adequately sanitize user-supplied input. Specifically, the issue exists in the "ZipArchive::extractTo()" function when extracting a ".zip" archive file containing filenames with directory traversal strings.

PHP Versions 5.2.6 and earlier are affected.

IMPACT:

A successful attack may allow an attacker to create or overwrite arbitrary files on the system. This may allow execution of arbitrary script code in the context of the Web server.

SOLUTION:

Upgrade to the latest PHP version which is available for download from the PHP web site (<http://www.php.net/>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 nvd

Reference: CVE-2008-5658

Description: Directory traversal vulnerability in the ZipArchive::extractTo function in PHP 5.2.6 and earlier allows context-dependent attackers to write arbitrary files via a ZIP file with a file whose name contains .. (dot dot) sequences.

4 PHP Python Extension "safe_mode" Restriction Bypass Vulnerability

port 80/tcp

QID: 12269
Category: CGI
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: 32902
Service Modified: 11/23/2015
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for Web development and can be embedded into HTML.

PHP is prone to a "safe_mode" restriction bypass vulnerability when the python extension is enabled. Specifically, this is caused by "safe_mode" failing to properly restrict python code embedded within PHP code.

IMPACT:

Successful exploits could allow an attacker to execute arbitrary code.

SOLUTION:

Workaround:
Disable use of the python extension in PHP.

Impact of workaround:
Applications and programs using the PHP python extension will stop working.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

PhpMyAdmin is a free software tool written in PHP intended to handle the administration of MySQL over the Internet. Multiple vulnerabilities have been reported in phpMyAdmin:

It was possible to manipulate the PHP session superglobal using some of the Swekey authentication code.

In the "relational schema" code a parameter was not sanitized before being used to concatenate a class name.

A local file inclusion issue exists in MIME-type transformation parameter.

An Cross-Scripting issue exists in table Print view.

Affected Versions:

phpMyAdmin versions prior to 3.3.10.3 and 3.4.3.2.

IMPACT:

If this vulnerability is successfully exploited, attackers can execute arbitrary PHP code or include arbitrary files from local resources.

SOLUTION:

The vendor has released a patch (phpMyAdmin Version 3.3.10.3, Version 3.4.3.2 or later) to resolve these issues. Refer to Vendor advisory PMASA-2011-9 (http://www.phpmyadmin.net/home_page/security/PMASA-2011-9.php), PMASA-2011-10 (http://www.phpmyadmin.net/home_page/security/PMASA-2011-10.php) , PMASA-2011-11 (http://www.phpmyadmin.net/home_page/security/PMASA-2011-11.php) and , PMASA-2011-12 (http://www.phpmyadmin.net/home_page/security/PMASA-2011-12.php)to address this issue and obtain further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

phpMyAdmin 3.3.10.3: all (phpMyAdmin 3.3.10.3)

(<http://cdnetworks-kr-2.dl.sourceforge.net/project/phpmyadmin/phpMyAdmin/3.3.10.3/phpMyAdmin-3.3.10.3-all-languages.zip>)

4 PHP Session Fixation Vulnerability

port 80/tcp

QID: 12722
Category: CGI
Associated CVEs: [CVE-2011-4718](#)
Vendor Reference: [PHP 5.5.2](#)
Bugtraq ID: 61929
Service Modified: 07/17/2014
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is suited for web development and can be embedded in HTML.

The detected PHP version is exposed to a session fixation vulnerability in the sessions subsystem. This issue allows remote attackers to hijack web sessions by specifying a session ID.

Affected Versions:

IMPACT:

SOLUTION:

- Implement the `session.use_strict_mode` php.ini directive which when enabled, discards uninitialized session IDs.
- Implement the `session.safe_session_cookie` directive that deletes possible malicious cookies, effectively preventing crafted session IDs.
- Implement the `session.use_trans_sid` directive that prevents PHP applications from exposing the session identifier in a URL.
- Implement the `session.use_only_cookies` php.ini directive that directs PHP to never use URLs with session identifiers.

Patch:

PHP 5.5.2 (<http://www.php.net/downloads.php>)

COMPLIANCE:

EXPLOITABILITY:

port 80/tcp

QID:	13083
Category:	CGI
Associated CVEs:	CVE-2014-8142
Vendor Reference:	PHP

Bugtraq ID: 71791
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

An use after free vulnerability has been confirmed in PHP which exist in the process_nested_data function in ext/standard/var_unserializer.re. The vulnerability existed as the language failed to properly handle object properties.

Affected Versions:

PHP versions prior to 5.4.36, 5.5.x before 5.5.20, and 5.6.x before 5.6.4

IMPACT:

Successful exploitation of this vulnerability will allow an attacker to execute arbitrary code, failed exploits may result in denial of service.

SOLUTION:

Users are advised to upgrade to the latest version of the PHP. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Category: General remote services
Associated CVEs: [CVE-2018-14883](#), [CVE-2018-14851](#), [CVE-2018-15132](#)
Vendor Reference: [PHP5 Change log](#), [PHP7 Change log](#)
Bugtraq ID: -
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is exposed to the following vulnerabilities:

Int Overflow lead to Heap OverFlow in `exif_thumbnail_extract` of `exif.c`. (CVE-2018-14883)

heap-buffer-overflow while reading `exif` data. (CVE-2018-14851)

windows `linkinfo` lacks `openbasedir` check. (CVE-2018-15132)

Affected Versions:

Versions prior to PHP 5.6.37, 7.1.20, 7.2.8, and 7.0.31 are vulnerable.

IMPACT:

Successful exploitation allows attacker to compromise the system.

SOLUTION:

Customers are advised to upgrade to the latest version of PHP. (<https://www.php.net/downloads.php>)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

php download (<https://www.php.net/downloads>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 nvd

Reference: CVE-2018-15132

Description: An issue was discovered in `ext/standard/link_win32.c` in PHP before 5.6.37, 7.0.x before 7.0.31, 7.1.x before 7.1.20, and 7.2.x before 7.2.8. The `linkinfo` function on Windows doesn't implement the `open_basedir` check. This could be abused to find files on paths outside of the allowed directories.

Link: <https://bugs.php.net/bug.php?id=76459>

Reference: CVE-2018-14883

Description: An issue was discovered in PHP before 5.6.37, 7.0.x before 7.0.31, 7.1.x before 7.1.20, and 7.2.x before 7.2.8. An Integer Overflow leads to a heap-based buffer over-read in `exif_thumbnail_extract` of `exif.c`.

Link: <https://bugs.php.net/bug.php?id=76423>

4 Apache HTTP Server Prior to 2.2.29 Multiple Vulnerabilities

port 80/tcp

QID: 86490
Category: Web server
Associated CVEs: [CVE-2014-0231](#), [CVE-2013-5704](#), [CVE-2014-0118](#), [CVE-2014-0226](#)
Vendor Reference: [Apache 2.2.29](#)
Bugtraq ID: 66550,68742,68745,68678
Service Modified: 03/12/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache HTTP Server is exposed to following vulnerabilities:

- mod_cgid denial of service (CVE-2014-0231)
- HTTP Trailers processing bypass (CVE-2013-5704)
- mod_deflate denial of service (CVE-2014-0118)
- mod_status buffer overflow (CVE-2014-0226)

Affected Versions:

Apache HTTP Server versions 2.2.x prior to 2.2.29

IMPACT:

Successfully exploiting these vulnerabilities might allow a remote attacker to bypass intended access restrictions or cause denial of service.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to [Apache httpd 2.2.29 Changelog](#) (http://httpd.apache.org/security/vulnerabilities_22.html) or your Linux distro for further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache 2.2.29: Apache 2.2.x (<http://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

Reference: CVE-2021-40438
Description: Ryuk
Link: <https://info.securin.io/hubfs/Securin%20Ransomware%20Report%202023.pdf>

ASSOCIATED MALWARE:

 Qualys Cloud Threat DB
Malware ID: Ryuk
Type: Ransomware
Link: <https://info.securin.io/hubfs/Securin%20Ransomware%20Report%202023.pdf>

RESULTS:

Vulnerable Version of Apache HTTP Server Detected on port: 80
Server: Apache/2.2.8 (Ubuntu) DAV/2

 4	Apache Hypertext Transfer Protocol (HTTP) Server Buffer Overflow Vulnerability	port 80/tcp
QID:	730312	
Category:	CGI	
Associated CVEs:	CVE-2021-44790	
Vendor Reference:	Apache HTTP Server Security Advisory	
Bugtraq ID:	-	
Service Modified:	04/06/2026	
User Modified:	-	
Edited:	No	
PCI Vuln:	Yes	

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.
A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).
Affected Versions:
Apache HTTP Server 2.4.51 and earlier

IMPACT:

SOLUTION:

Patch:

Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Not Applicable

4 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.55 Multiple Security Vulnerabilities

port 80/tcp

QID: 731513
Category: CGI
Associated CVEs: [CVE-2006-20001](#), [CVE-2022-37436](#)
Vendor Reference: [Apache_http_server](#)
Bugtraq ID: -
Service Modified: 08/20/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.

CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:

Apache HTTP Server versions prior to 2.4.55

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.

For further information, please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -

Date: Thu, 23 Jul 2026 07:20:58 GMT

Server: Apache/2.2.8 (Ubuntu) DAV/2

	4	Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.58 Multiple Security Vulnerabilities	port 80/tcp
QID:	731517		
Category:	CGI		
Associated CVEs:	CVE-2023-31122 , CVE-2023-45802		
Vendor Reference:	Apache_http_server		
Bugtraq ID:	-		
Service Modified:	04/21/2026		
User Modified:	-		
Edited:	No		
PCI Vuln:	No		

Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server. This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server versions prior to 2.4.58

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.
For further information, please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html).

Apache HTTP Server is an HTTP web server application.

CVE-2024-38472: SSRF in Apache HTTP Server on Windows allows to potentially leak NTLM hashes to a malicious server via SSRF and malicious requests or content

CVE-2024-38473: Apache HTTP Server proxy encoding problem

CVE-2024-38474: Apache HTTP Server weakness with encoded question marks in backreferences

CVE-2024-38475: Apache HTTP Server weakness in mod_rewrite when first segment of substitution matches filesystem path.

CVE-2024-38476: Apache HTTP Server may use exploitable/malicious backend application output to run local handlers via internal redirect

CVE-2024-38477: Apache HTTP Server Crash resulting in Denial of Service in mod_proxy via a malicious request
CVE-2024-39573: Apache HTTP Server mod_rewrite proxy handler substitution

Affected Versions:
Apache HTTP Server versions prior to 2.4.60

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd

3 PHP Multiple Vulnerabilities May 2008

QID: 12249
Category: CGI
Associated CVEs: [CVE-2008-0599](#), [CVE-2008-2050](#), [CVE-2008-2051](#)
Vendor Reference: [PHP 5.2.6](#), [RHSA-2008:0545](#), [RHSA-2008:0544](#), [RHSA-2008:0546](#)
Bugtraq ID: 29009
Service Modified: 02/29/2024
User Modified: -
Edited: No

PCI Vuln: Yes

THREAT:

PHP versions before 5.2.6 are prone to multiple security vulnerabilities, including:

- 1) An unspecified error in the FastCGI SAPI
- 2) An

error in the processing of multibyte characters within the "escapeshellcmd()" and "escapeshellarg()" functions

- 3) A

vulnerability due to an error during path translation in cgi_main.c

- 4) An error in cURL
- 5) A boundary error in PCRE

IMPACT:

Successful exploits could allow an attacker to bypass security restrictions, cause a denial of service, and potentially execute code.

SOLUTION:

Upgrade to PHP Version 5.2.6 or greater.

For Red Hat refer to vendor advisory RHSA-2008-0546 (<http://rhn.redhat.com/errata/RHSA-2008-0546.html>), RHSA-2008-0545 (<http://rhn.redhat.com/errata/RHSA-2008-0545.html>) and RHSA-2008-0544 (<http://rhn.redhat.com/errata/RHSA-2008-0544.html>) to address this issue and obtain further details.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

3 Apache HTTP Server APR "apr_fnmatch()" Denial of Service Vulnerability

QID:	12500
Category:	CGI
Associated CVEs:	CVE-2011-0419
Vendor Reference:	Apache 2.2.19, Apache HTTP Server 2.0 Vulnerabilities
Bugtraq ID:	-
Service Modified:	02/28/2024
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The Apache HTTP Server is a freely available Web server.

The vulnerability is caused by an infinite recursion error within the `apr_fnmatch()` function when processing certain patterns. This can be exploited to cause a stack overflow via a specially crafted request containing wildcard characters (e.g. `"*"`).

IMPACT:

This vulnerability can be exploited by malicious people to cause a denial of service.

SOLUTION:

The vendor has released Apache HTTP Server version 2.2.19 Apache 2.2.19 (http://httpd.apache.org/security/vulnerabilities_22.html) to resolve these issues.

The vendor also released Apache HTTP Server version 2.0.65-DEV. The latest version is available for download from Apache Web site (<http://httpd.apache.org/>)

Patch:
Following are links for downloading patches to fix the vulnerabilities:

Apache: Linux (HTTP) (<http://httpd.apache.org/download.cgi>)

Apache: Windows (HTTP) (<http://httpd.apache.org/download.cgi>)

2.0.65-DEV: Apache 2.0.x (HTTP) (<http://httpd.apache.org/download.cgi#apache20>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

3 MySQL MyISAM Table Security Bypass Vulnerability

QID:	19234
Category:	Database
Associated CVEs:	CVE-2008-2079
Vendor Reference:	MYSQL 6.0.5 , MYSQL 5.1.24 , MYSQL 5.0.60 , MYSQL 4.1.24
Bugtraq ID:	29106,31681
Service Modified:	02/29/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

A security bypass vulnerability exists in MYSQL versions 4.1.x before 4.1.24, versions 5.0.x before 5.0.60, versions 5.1.x before 5.1.24, and versions 6.0.x before 6.0.5. This issue is due to an error in the MyISAM table.

IMPACT:

This vulnerability allows local users to bypass certain privilege checks by calling CREATE TABLE on a MyISAM table with modified DATA DIRECTORY

and INDEX DIRECTORY options to overwrite existing table files in the MySQL data directory.

SOLUTION:

Refer to these articles for the latest information and upgrades:

MYSQL 6.0.5 (<http://dev.mysql.com/doc/refman/6.0/en/news-6-0-5.html>)

MYSQL 5.1.24 (<http://dev.mysql.com/doc/refman/5.1/en/news-5-1-24.html>)

MYSQL 5.0.60 (<http://dev.mysql.com/doc/refman/5.0/en/releasenotes-es-5-0-60.html>)

MYSQL 4.1.24 (<http://dev.mysql.com/doc/refman/4.1/en/news-4-1-24.html>)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

MySQL 4.1.24: MySQL (Database) (<http://dev.mysql.com/doc/refman/4.1/en/news-4-1-24.html>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

Reference: CVE-2008-2079

Description: MySQL 4.1.x before 4.1.24, 5.0.x before 5.0.60, 5.1.x before 5.1.24, and 6.0.x before 6.0.5 allows local users to bypass certain privilege checks by calling CREATE TABLE on a MyISAM table with modified (1) DATA DIRECTORY or (2) INDEX DIRECTORY arguments that are within the MySQL home data directory, which can point to tables that are created in the future.

Link: <http://bugs.mysql.com/bug.php?id=32167>

nist-nvd2

3 MySQL Command Line Client HTML Special Characters HTML Injection Vulnerability

QID: 19264

Category: Database

Associated CVEs: [CVE-2008-4456](#)

Vendor Reference: [MYSQL](#)

Bugtraq ID: 31486 ,31486

Service Modified: 02/28/2024

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

MySQL is prone to an HTML injection vulnerability because the application's command-line client fails to properly sanitize user-supplied input before using it in dynamically generated content.

IMPACT:

Attacker-supplied HTML and script code would run in the context of the affected browser, potentially allowing the attacker to steal cookie-based authentication credentials or to control how the site is rendered to the user. Other attacks are also possible.

SOLUTION:

MYSQL has released a patch to address this issue. Refer to MySQL Bug #27884 (<http://bugs.mysql.com/bug.php?id=27884>) for further details on these vulnerabilities and patch instructions.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

MySQL Bug 27884 (<http://bugs.mysql.com/bug.php?id=27884>)

COMPLIANCE:

3 OpenSSH Xauth Command Injection Vulnerability

QID: 38623

Category: General remote services

Associated CVEs: [CVE-2016-3115](#)

Vendor Reference: [OpenSSH 7.2p2](#)

Bugtraq ID: 84314

Service Modified: 08/14/2024

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

The sshd server fails to validate user-supplied X11 authentication credentials when establishing an X11 forwarding session. An authenticated user may inject arbitrary xauth commands by sending an x11 channel request that includes a newline character in the x11 cookie. Please note that Systems with X11Forwarding enabled are affected.

Affected Versions:

OpenSSH versions prior to 7.2p2

IMPACT:

An authenticated, remote attacker can exploit this vulnerability to execute arbitrary commands on the targeted system.

SOLUTION:

Users are advised to upgrade to the latest version of the software available. Refer to OpenSSH 7.2p2 Release Notes (<http://www.openssh.com/txt/release-7.2p2>) for further information.

Patch:

3 OpenSSH Denial of Service (DoS) Vulnerability

QID: 38866
Category: General remote services
Associated CVEs: [CVE-2011-5000](#)
Vendor Reference: [Openssh](#)
Bugtraq ID: -
Service Modified: 09/23/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

The `ssh_gssapi_parse_ename` function in `gss-serv.c` in OpenSSH 5.8 and earlier, when `gssapi-with-mic` authentication is enabled, allows remote authenticated users to cause a denial of service (memory consumption) via a large value in a certain length field.

Affected Versions:
OpenSSH before 5.9

IMPACT:

Allows remote authenticated users to cause a denial of service.

SOLUTION:

Customers are advised to upgrade to OpenSSH 5.9 (<https://www.openssh.com/txt/release-5.9>) or later to remediate these vulnerabilities.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

3 OpenSSH Command Injection Vulnerability

QID: 38901
Category: General remote services
Associated CVEs: [CVE-2020-15778](#)
Vendor Reference: [openssh](#)
Bugtraq ID: -
Service Modified: 07/30/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

OpenSSH through 8.3p1 allows command injection in the scp.c toremote function, as demonstrated by backtick characters in the destination argument. NOTE: the vendor reportedly has stated that they intentionally omit validation of "anomalous argument transfers" because that could "stand a great chance of breaking existing workflows."

Affected Versions:
OpenSSH versions prior to 8.3

IMPACT:

Successful exploitation allows a remote attacker for command injection in the scp.c toremote function .

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.3 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

3 OpenSSH User Enumeration Vulnerability (CVE-2016-6210)

QID: 38907
Category: General remote services
Associated CVEs: [CVE-2016-6210](#)
Vendor Reference: [OpenSSH 7.3](#)
Bugtraq ID: -
Service Modified: 05/05/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

When SHA256 or SHA512 are used for user password hashing, uses BLOWFISH hashing on a static password when the username does not exist, which allows remote attackers to enumerate users by leveraging the timing difference between responses when a large password is provided.

Affected Versions:
OpenSSH versions prior to 7.3

IMPACT:

Successful exploitation allows a remote attacker to obtain user information affecting confidentiality.

SOLUTION:

Customers are advised to upgrade to OpenSSH 7.3 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:

3 OpenSSH Multiple CRLF injection Vulnerability (CVE-2016-3115)

QID: 38985
Category: General remote services
Associated CVEs: [CVE-2016-3115](#)
Vendor Reference: [x11fwd.adv](#)
Bugtraq ID: -
Service Modified: 05/03/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:
OpenSSH before version 7.2p2

IMPACT:

Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.

SOLUTION:

Customers are advised to upgrade to x11fwd.adv (<http://www.openssh.com/txt/x11fwd.adv>) or later to remediate this vulnerability.

3 OpenSSH Plaintext Recovery Attack Against SSH Vulnerability

QID: 42339
Category: General remote services
Associated CVEs: [CVE-2008-5161](#)
Vendor Reference: [openssh-5.2 release note](#)
Bugtraq ID: 32319
Service Modified: 05/29/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH is prone to a plain text recovery attack. The issue is in the SSH protocol specification itself and exists in Secure Shell (SSH) software when used with CBC-mode ciphers.

Affected Versions:
OpenSSH Version 5.1 and earlier.

IMPACT:

This issue can be exploited by a remote unprivileged user to gain access to some of the plain text information from intercepted SSH network traffic, which would otherwise be encrypted.

SOLUTION:

Upgrade to OpenSSH 5.2 or later, available from the OpenSSH OpenSSH Download site (<http://www.openssh.com/openbsd.html>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

OpenSSH 5.2: OpenSSH (<ftp://ftp.openbsd.org/pub/OpenBSD/OpenSSH/>)

3 OpenSSH X11 Forwarding Information Disclosure

QID: 42378
Category: General remote services
Associated CVEs: [CVE-2008-3259](#)
Vendor Reference: [OpenSSH 5.1](#)
Bugtraq ID: 30339
Service Modified: 07/18/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH is exposed to an information disclosure vulnerability caused by an error when binding to previously bound ports that have the

SO_REUSEADDR option enabled and the sshd_config X11UseLocalhost option set to no.

Affected Versions:

OpenSSH Versions prior to 5.1 are vulnerable.

IMPACT:

Successfully exploiting this issue may allow an attacker to obtain sensitive information on systems where effective user-id or overlapping bind address checks are not present.

SOLUTION:

Upgrade to OpenSSH 5.1 or later, available from the OpenSSH OpenSSH 5.1 release notes (<http://www.openssh.com/txt/release-5.1>).

3 OpenSSH J-PAKE Session Key Retrieval Vulnerability

QID: 42384
Category: General remote services
Associated CVEs: [CVE-2010-4478](#)
Vendor Reference: [OpenSSH J-PAKE](#)
Bugtraq ID: 45304
Service Modified: 05/29/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH, when J-PAKE is enabled, does not properly validate the public parameters in the J-PAKE protocol. This allows remote attackers to bypass the need for knowledge of the shared secret, and successfully authenticate, by sending crafted values in each round of the protocol.

Affected Software:
OpenSSH versions 5.6 and prior.

IMPACT:

Successful exploitation allows attacker to get access to the remote system.

SOLUTION:

Upgrade to OpenSSH 5.7 or later, available from the OpenSSH Web site (<http://www.openssh.com/>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

OpenSSH J-PAKE (<http://www.openssh.com/>)

3 OpenSSH LoginGraceTime Denial of Service Vulnerability

QID: 42413
Category: General remote services
Associated CVEs: [CVE-2010-5107](#)
Vendor Reference: [OpenSSH](#)
Bugtraq ID: 58162 ,58162
Service Modified: 05/30/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Default OpenSSH installations have an overly long LoginGraceTime and a lack of early connection release for MaxStartups settings. Remote unauthenticated attackers could bypass the LoginGraceTime and MaxStartups thresholds by intermittently transmitting a large number of new TCP connections to the targeted server. This could lead to connection slot exhaustion.

Affected Software:
OpenSSH 6.1 and prior.

IMPACT:

Successful exploitation could allow an unauthenticated remote attacker to cause the targeted server to stop responding to legitimate user queries, leading to a denial of service on the targeted server.

SOLUTION:

Customers are advised to upgrade to OpenSSH 6.2 (<http://www.openssh.org/>) and apply the associated server configuration settings to remediate this vulnerability.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
OpenSSH 6.2 (<http://www.openssh.org/>)

3 Samba "mount.cifs" Race Condition Security Issue

QID: 70054
Category: SMB / NETBIOS
Associated CVEs: [CVE-2010-0787](#)
Vendor Reference: -

Bugtraq ID: 37992,39898
Service Modified: 04/25/2013
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a file and printer-sharing application that allows users to share files and printers between operating systems on Unix and Windows platforms.

Samba is prone to a local privilege-escalation vulnerability in the "mount.cifs" utility. Specifically, when the application is installed as a setuid program, a race condition occurs when verifying user permissions. This issue can be exploited by replacing mountpoints with symlinks.

Successful privilege escalation may require that the "mount.cifs" utility is suid root.

Affected versions:

Samba 3.0.22, 3.0.28a, 3.2.3, 3.3.2, 3.4.0, and 3.4.5.

IMPACT:

This may cause the application to mount filesystems in arbitrary locations. Local attackers can exploit this issue to gain elevated privileges on affected computers.

SOLUTION:

Update to the latest supported version of Samba. Refer to <http://www.samba.org/> (<http://www.samba.org/>) for the latest release.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba Bug 6853: SAMBA (<http://www.samba.org/samba/download/>)

COMPLIANCE:

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Samba 3.0.20-Debian

3 Samba Multiple Remote Denial of Service Vulnerabilities

QID: 70057
Category: SMB / NETBIOS
Associated CVEs: [CVE-2010-1635](#), [CVE-2010-1642](#)
Vendor Reference: [Samba 3.4.8 Release Notes](#), [Samba 3.5.2 Release Notes](#)
Bugtraq ID: 40097
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Samba is a freely available file and printer sharing application maintained and developed by the Samba Development Team. Samba allows users to share files and printers between operating systems on UNIX and Windows platforms.

Samba is prone to multiple vulnerabilities that can cause smbd to crash.

Versions prior to 3.4.8 and prior to 3.5.2 are vulnerable.

IMPACT:

An attacker can exploit these issues to crash the application, denying service to legitimate users.

SOLUTION:

The vendor has released updates to resolve this issue. Update to Samba 3.4.8 and 3.5.2 to resolve the issue. Refer to Release Notes 3.5.2 (<http://samba.org/samba/history/samba-3.5.2.html>) and Release Notes 3.4.8 (<http://samba.org/samba/history/samba-3.4.8.html>) to obtain additional details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba 3.5.2 (Samba 3.5.2) (<http://www.samba.org/samba/ftp/stable/samba-3.5.2.tar.gz>)

3 Samba FD_SET Memory Corruption Vulnerability

QID: 70061
Category: SMB / NETBIOS
Associated CVEs: [CVE-2011-0719](#)
Vendor Reference: [Samba 3.5.7](#)
Bugtraq ID: 46597
Service Modified: 05/12/2023
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Samba is a freely available file and printer sharing application. Samba allows users to share files and printers between operating systems on UNIX and Windows platforms.

Samba is prone to a memory corruption vulnerability caused by missing range checks on file descriptors related to the "FD_SET" macro, which can be exploited to corrupt stack-based memory by performing a select on a specially crafted file descriptor set.

Samba Versions 3.0.x to 3.3.14, 3.4.x to 3.4.11 and 3.5.x to 3.5.6 are vulnerable.

IMPACT:

Successful exploitation allows malicious local users to cause a denial of service.

SOLUTION:

The vendor has released patches as well as a new version (Samba 3.5.7) to resolve this issue. Refer to Samba Advisory for CVE-2011-0719 (<http://samba.org/samba/security/CVE-2011-0719.html>) to obtain additional details about this vulnerability.

Patch:

QID:	86840
Category:	Web server
Associated CVEs:	CVE-2009-1195 , CVE-2008-1678
Vendor Reference:	Apache Revision 772997 , RHSA-2009:1075
Bugtraq ID:	31692,31681,35115
Service Modified:	02/29/2024
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The Apache HTTP Server is a freely-available Web server.

- Apache HTTP Server is prone to a security issue that exists in the handling of the "Options" and "AllowOverride" directives. This flaw can be exploited by local users to execute commands from a Server-Side-Include script when processing "AllowOverride" directives and certain "Options" arguments in ".htaccess" files. (CVE-2009-1195)

- A denial of service vulnerability exists due to improper handling of compression structures between mod_ssl and OpenSSL. This can be exploited to cause a system crash if too many connections are opened in a short period of time, causing all system memory and swap space to be consumed by httpd.

Apache HTTP Server 2.2.11 and earlier 2.2 versions are affected.

The remote detection is based on the web server fingerprint of the target server.

IMPACT:

If this vulnerability is successfully exploited, it can allow malicious, local users to bypass certain security restrictions and give the ability to execute commands from a Server-Side-Include script. (CVE-2009-1195)

If too many connections are opened in a short period of time, all system memory and swap space would be consumed by httpd causing a system crash. (CVE-2008-1678).

SOLUTION:

Apache SVN (CVE-2009-1195):

This issue has been fixed in the SVN repository. Refer to Apache Revision 772997 (<http://svn.apache.org/viewvc?view=rev&revision=772997>) to obtain additional details on this vulnerability.

Red Hat Linux (CVE-2009-1195, CVE-2008-1678):

Updated httpd packages to fix these issues are available for Red Hat Enterprise Linux 5. Upgrade to the latest packages which contain a patch. These are available from the Red Hat Network (<https://www.redhat.com/wapps/ssos/rhn/login.html?redirect=http%3A%2F%2Frhn.redhat.com%2Frhn%2FYourRhn.do>).

Steps on using the Red Hat Network (RHN) to apply packages are listed as follows:

For Red Hat Enterprise Linux Versions 2.1, 3, and 4, the interactive Update Agent can be launched with the "up2date" command.

For Red Hat Enterprise Linux Version 5, the graphical Update tool can be launched with the "pup" command.

To install packages using the command-line interface, use the command "yum update".

Refer to Red Hat security advisory RHSA-2009:1075 (<http://rhn.redhat.com/errata/RHSA-2009-1075.html>) to address this issue and obtain further details.

Patch:

Link: https://bugzilla.redhat.com/show_bug.cgi?id=489436

Successful exploits may allow remote attackers to cause denial of service conditions and compromise a vulnerable system.

SOLUTION:

For Apache 2.2.x ,update to Apache Version 2.2.13 or later which is available from the Apache HTTP Server Download site (<http://httpd.apache.org/download.cgi>).

For Apache 2.0.x ,update to Apache Version 2.0.64 which is available from the Apache HTTP Server Download site (<http://httpd.apache.org/download.cgi>).

Fedora has issued updates for the "apr-util" package to fix this vulnerability. Updates can be installed using the yum utility which can be downloaded from the Fedora Web site (<http://docs.fedoraproject.org/yum/>).

Refer to Fedora security advisories FEDORA-2009-8360

(<https://www.redhat.com/archives/fedora-package-announce/2009-August/msg00353.html>), FEDORA-2009-8336

(<https://www.redhat.com/archives/fedora-package-announce/2009-August/msg00320.html>), FEDORA-2009-8318

(<https://www.redhat.com/archives/fedora-package-announce/2009-August/msg00299.html>) and FEDORA-2009-8349

(<https://www.redhat.com/archives/fedora-package-announce/2009-August/msg00342.html>) to address the issue and obtain patch details.

3 Apache mod_proxy_ftp FTP Command Injection Vulnerability

QID:	86855
Category:	Web server
Associated CVEs:	CVE-2009-3095
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	01/16/2012
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache `mod_proxy_ftp` is a module for the Apache Web server to handle FTP proxy requests.

A vulnerability exists in the Apache "mod_proxy_ftp" module, which is caused due to an input validation error in the module. This can be exploited to pass arbitrary FTP commands to the FTP server via a specially crafted "Authorization" header in a request to the Apache server.

The vulnerability is confirmed in Apache Versions 2.2.13, 2.0.63 and 1.3.41. Other versions may also be affected.

IMPACT:

Successful exploitation of this vulnerability can allow an attacker to bypass certain security restrictions.

SOLUTION:

Workaround:
Restrict network access to the proxy server to trusted users only.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

Apache 2.2.14: Apache (<http://httpd.apache.org/download.cgi>)

SOLUTION:

Patch:

Apache 2.2.16 (Apache 2.2.16) (<http://labs.renren.com/apache-mirror/httpd/httpd-2.2.16.tar.bz2>)

3 Apache HTTP Server multiple vulnerabilities

QID:	86975
Category:	Web server
Associated CVEs:	CVE-2011-3607 , CVE-2012-0031 , CVE-2011-4415
Vendor Reference:	Apache
Bugtraq ID:	50494,51407,51706
Service Modified:	09/30/2025
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache HTTP Server is prone to multiple issues:-

1. A local privilege escalation vulnerability because of an integer overflow error. Specifically, the error exists in the "ap_pregsub()" function of the "server/util.c" source file.
2. A flaw was found in the handling of the scoreboard. An unprivileged child process could cause the parent process to crash at shutdown rather than terminate cleanly.

Affected Versions:

Apache HTTP Server 2.0.x through 2.0.64 and 2.2.x through 2.2.21.

IMPACT:

By exploiting this vulnerability, attackers can run arbitrary code with elevated privileges.

SOLUTION:

This issue has been patched in Apache 2.2.22. Refer to Apache 2.2 Security Vulnerabilities (http://httpd.apache.org/security/vulnerabilities_22.html).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache 2.2 (Apache HTTP Server) (<http://httpd.apache.org/download.cgi#apache22>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

The Exploit-DB

User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache server is affected by multiple issues:

Insecure LD_LIBRARY_PATH handling

Cross-site scripting in mod_negotiation when untrusted uploads are supported

Affected Versions:

Apache HTTP Server prior to version 2.2.23

Apache HTTP Server prior to version 2.4.2

IMPACT:

Successful exploitation may lead to execution of arbitrary code on the system within the context of the affected applications.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to Apache httpd 2.2 Security Vulnerabilities (http://httpd.apache.org/security/vulnerabilities_22.html) and Apache httpd 2.4 Security Vulnerabilities (http://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache (Apache HTTP Server) (<http://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

QID 87133 detected on port 80 -

Date: Thu, 23 Jul 2026 07:20:58 GMT

3 Apache HTTP Server mod_deflate Denial of Service Vulnerability

QID: 87179
Category: Web server
Associated CVEs: [CVE-2009-1891](#)
Vendor Reference: [Apache HTTP Server 2.2 Vulnerabilities](#)
Bugtraq ID: -
Service Modified: 07/16/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache HTTP Server mod_deflate module is exposed to a denial of service vulnerability because this module continued to compress large files until compression was complete, even if the network connection that requested the content was closed before compression completed. This would cause mod_deflate to consume large amounts of CPU if mod_deflate was enabled for a large file.

Affected Versions:
Apache httpd 2.2.x before 2.2.12, 2.0.x before 2.0.64 are vulnerable.

IMPACT:

Successful exploitation may lead to a denial of service.

SOLUTION:

Update to Apache 2.2.12 or later. Refer to Apache HTTP Server Vulnerabilities (http://httpd.apache.org/security/vulnerabilities_22.html) for further details.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP Server (<http://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

Reference: CVE-2009-1891
Description: The mod_deflate module in Apache httpd 2.2.11 and earlier compresses large files until completion even after the associated network connection is closed, which allows remote attackers to cause a denial of service (CPU consumption).
Link: <http://bugs.debian.org/cgi-bin/bugreport.cgi?bug=534712>

Reference: CVE-2009-1891
Description: The mod_deflate module in Apache httpd 2.2.11 and earlier compresses large files until completion even after the associated network connection is closed, which allows remote attackers to cause a denial of service (CPU consumption).
Link: <http://marc.info/?l=apache-httpd-dev&m=124621326524824&w=2>

nist-nvd2

Link: <http://marc.info/?l=apache-httpd-dev&m=124621326524824&w=2>

THREAT:

Samba is a re-implementation of SMB/CIFS networking protocol.

A heap-based buffer overflow flaw exists in the way Samba clients handle over-sized packets.

Samba Versions 3.0.0 through 3.0.29 are vulnerable.

IMPACT:

If a client connects to a malicious Samba server, it is possible to execute arbitrary code as the Samba client user. It is also possible for a remote user to send a specially crafted print request to a Samba server. Successful exploitation could result in the server executing the vulnerable client code, causing arbitrary code execution with the permissions of the Samba server.

SOLUTION:

Samba administrators are advised to upgrade to 3.0.30 or apply the patch as soon as possible.

Red Hat users refer to Red Hat security advisory RHSA-2008-0288 (<https://rhn.redhat.com/errata/RHSA-2008-0288.html>) to address this security vulnerability and obtain further details.

Install VMWare ESX Server Version 3.5 Patch ESX350-200806218-UG (<http://kb.vmware.com/kb/1005931>) to address this security vulnerability.

Refer to HP-UX advisory c01475657 (http://www11.itrc.hp.com/service/cki/docDisplay.do?docId=emr_na-c01475657).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

RHSA-2008-0288 (<https://rhn.redhat.com/errata/RHSA-2008-0288.html>)

VMWare ESX 3.5 (<http://kb.vmware.com/kb/1005931>)

Samba 3.0.20-Debian

3 PHP "proc_open()" Environment Parameter Safe Mode Restriction-Bypass Vulnerability

QID: 116092

Category: Local

Associated CVEs: -

Vendor Reference: -

Bugtraq ID: 32717

Service Modified: 01/08/2009

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for Web development and can be embedded into HTML.

PHP is prone to a "safe_mode" restriction bypass vulnerability. Specifically, this issue is caused by the "env" parameter to the "proc_open()" function overriding the "safe_mode_exec_dir" directive. A malicious PHP script may exploit this issue to load arbitrary shared libraries via the "LD_PRELOAD" environment variable, bypassing "safe_mode_exec_dir" restrictions.

PHP Versions 5.x-5.2.8 on Linux is affected.

IMPACT:

An attacker able to place shared library code in a readable location may exploit this issue to execute this code through a malicious PHP script. This vulnerability would be an issue in shared-hosting configurations where multiple users can create and execute arbitrary PHP script code, with the "safe_mode" restrictions assumed to isolate the users from each other.

SOLUTION:

There are no vendor-supplied patches available at this time.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

PCI Vuln: Yes

THREAT:

VSftpd is a secure FTP server for Linux, UNIX, and similar operating systems.

The application is exposed to a backdoor issue because the "vsftpd-2.3.4.tar.gz" source package file contains a backdoor. An attacker can cause the application to open a backdoor on port 6200 by logging in to the FTP server with the username ':)'.
Affected Versions:
VSftpd 2.3.4

IMPACT:

If this vulnerability is successfully exploited, attackers can execute arbitrary shell commands within the context of the affected application.

SOLUTION:

Download Version 2.3.4 or later from official website again to resolve this issue. The latest version is available for download from VSftpd Web site (<http://vsftpd.beasts.org/#download>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

RESULTS:

Possible vulnerable version of VSftpd detected.

 3 PHP "safe_mode" Multiple Security Bypass Vulnerabilities

port 80/tcp

QID: 12255
Category: CGI
Associated CVEs: [CVE-2008-2666](#), [CVE-2008-2665](#)
Vendor Reference: [Php 5.2.7](#)
Bugtraq ID: 29796, 29797
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is prone to multiple "safe_mode" restriction bypass vulnerabilities.

Multiple directory traversal vulnerabilities in PHP 5.2.6 and earlier allow context-dependent attackers to bypass safe_mode restrictions by creating a subdirectory named http: and then placing ../ (dot dot slash) sequences in an http URL argument to the (1) chdir or (2) ftok function.(CVE-2008-2666).

Directory traversal vulnerability in the posix_access function in PHP 5.2.6 and earlier allows remote attackers to bypass safe_mode restrictions via a .. (dot dot) in an http URL, which results in the URL being canonicalized to a local filename after the safe_mode check has successfully run.(CVE-2008-2665).

Php versions 5.2.6 and earlier are affected by this issues.

IMPACT:

Successful exploitation would allow an attacker to determine the presence of files in unauthorized locations. Exploiting these issues allows attackers to obtain sensitive data that could be used in other attacks.

SOLUTION:

The vendor has released PHP Version 5.2.7 to address these issues. It is available for download from the PHP Download Web site (<http://www.php.net/downloads.php/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.2.7 (PHP 5.2.7) (<http://www.php.net/downloads.php/>)

COMPLIANCE:

Not Applicable

3 PHP 'popen()' Function Buffer Overflow Vulnerability

port 80/tcp

QID: 12271
Category: CGI
Associated CVEs: [CVE-2009-3294](#)
Vendor Reference: [PHP 5.2.11 Release Notes](#), [PHP 5.3.1 Release Notes](#)
Bugtraq ID: 33216
Service Modified: 05/02/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML. The "popen" function opens a pipe to the program specified in the command parameter.

PHP is prone to a buffer overflow vulnerability that occurs in the "popen" function because it fails to perform adequate boundary checks before copying user-supplied data to insufficiently sized memory buffers. This issue can be exploited by passing a large string to the "mode" argument of the function.

PHP Versions before 5.2.11 and Version 5.3.x before 5.3.1 are affected.

IMPACT:

If this vulnerability is successfully exploited, a malicious user can execute arbitrary machine code in the context of the affected Web server.

Failed attempts cause denial of service attacks by crashing the Web server.

SOLUTION:

This issue is resolved in PHP Version 5.2.11 and later or Version 5.3.1 or later. Refer to [PHP 5.2.11 Release Notes](#) (http://www.php.net/releases/5_2_11.php) and [PHP 5.3.1 Release Notes](#) (http://www.php.net/releases/5_3_1.php) to obtain additional details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP: Unix (PHP) (<http://www.php.net/downloads.php/>)

PHP: Windows (PHP) (<http://windows.php.net/download/>)

Scan Results

Edited:	No
PCI Vuln:	No

THREAT:

The "mbstring.func_overload" PHP directive in php.ini is used to overload a set of single byte functions.

A denial of service vulnerability exists in PHP because the global scope for "mbstring.func_overload" directive related to unicode text operations is not set appropriately when it is used in a virtual server. When "mbstring.func_overload" is set to 7 in a .htaccess file, it causes the setting to be set globally for the Web server breaking most unicode text operations and hampering other sites hosted by the Web server.

PHP Versions 5.2.5 and earlier are affected.

IMPACT:

If this vulnerability is successfully exploited, it will allow malicious users to crash the affected Web server causing a denial of service.

SOLUTION:

Upgrade to the latest version of PHP (<http://www.php.net/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

QID: 12318
Category: CGI
Associated CVEs: [CVE-2009-3557](#), [CVE-2009-3558](#), [CVE-2009-4017](#), [CVE-2009-4142](#), [CVE-2009-4143](#)
Vendor Reference: [PHP 5.2.12](#)
Bugtraq ID: 37389,37390
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for Web development and can be embedded into HTML.

The following vulnerabilities exist in PHP:

- 1) An error in "tempnam()" can be exploited to bypass the "safe_mode" feature.
- 2) An error in "posix_mkfifo()" can be exploited to bypass the "open_basedir" feature.
- 3) An error within the processing of form-based file uploads can be exploited to cause a DoS by sending specially crafted requests.
- 4) Errors related to a insufficient protection of \$_SESSION against interrupt corruption and a weak "session.save_path" check have unknown impacts.
- 5) The "htmlspecialchars()" function does not properly sanitize certain input, which can be exploited to conduct cross-site scripting attacks.

PHP versions prior to 5.2.12 and prior to 5.3.1 are affected by these vulnerabilities.

IMPACT:

Successfully exploiting these issue may allow remote attackers to bypass certain security restrictions or to conduct cross-site scripting attacks and cause a denial of service.

SOLUTION:

The vendor has released PHP Version 5.2.12 and 5.3.1 to address these issues. It is available for download from the PHP Download Web site (<http://www.php.net/downloads.php/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

 3 phpMyAdmin Backtrace Cross-Site Scripting Vulnerability (PMASA-2010-6) port 80/tcp

QID:	12409
Category:	CGI
Associated CVEs:	CVE-2010-3056
Vendor Reference:	PMASA-2010-6
Bugtraq ID:	42584
Service Modified:	02/29/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

phpMyAdmin is a free software tool written in PHP intended to handle the administration of MySQL over the Internet.

phpMyAdmin is prone to a cross-site scripting vulnerability because certain unspecified input is not properly sanitized before being returned to the user via debug messages in a backtrace. This can be exploited to execute arbitrary HTML and script code in a user's browser session in the context of an affected site.

phpMyAdmin 3.x Versions before 3.3.6 are affected.

IMPACT:

Successful exploitation allows attackers to conduct cross-site scripting attacks.

SOLUTION:

Update to Version 3.3.6 to resolve this issue. The latest version is available for download from the PHPMYAdmin Web site (http://www.phpmyadmin.net/home_page/downloads.php).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PMASA-2010-6 (phpMyAdmin)

 3 phpMyAdmin Unspecified Cross-Site Scripting Vulnerability (PMASA-2010-7)

port 80/tcp

QID:	12415
Category:	CGI
Associated CVEs:	CVE-2010-2958
Vendor Reference:	PMASA-2010-7
Bugtraq ID:	-
Service Modified:	04/30/2012
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

PhpMyAdmin is a free software tool written in PHP intended to handle the administration of MySQL over the Internet.

Certain unspecified input passed to the setup script in PhpMyAdmin is not properly sanitized before being returned to the user. This can be exploited to execute arbitrary HTML and script code in a user's browser session in the context of an affected site.

Successful exploitation requires that the setup scripts have not been deleted after a successful installation.

Affected Versions:

3.x: versions before 3.3.7

IMPACT:

Successful exploitation allows attackers to conduct cross-site scripting attacks.

SOLUTION:

Update to Version 3.3.7 to resolve this issue. The latest version is available for download fromPhpMyAdmin Web site (http://www.phpmyadmin.net/home_page/downloads.php).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

phpMyAdmin 3.3.7: phpMyAdmin 3.3.7
(http://downloads.sourceforge.net/project/phpmyadmin/phpMyAdmin/3.3.7/phpMyAdmin-3.3.7-all-languages.7z?r=http%3A%2F%2Fwww.phpmyadmin.net%2Fhome_page%2Fdownloads.php&ts=1284028491&use_mirror=cdnetworks-kr-1)

3 phpMyAdmin Database Search Cross-Site Scripting Vulnerability (PMASA-2010-8)

port 80/tcp

QID: 12456
Category: CGI
Associated CVEs: [CVE-2010-4329](#)
Vendor Reference: [PMASA-2010-8](#)
Bugtraq ID: 45100
Service Modified: 12/06/2010
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PhpMyAdmin is a free software tool written in PHP intended to handle the administration of MySQL over the Internet.

PhpMyAdmin is prone to cross-site scripting vulnerability because certain input passed to the database search script is not properly sanitized before being returned to the user.

PhpMyAdmin Versions prior to 2.11.11.1 and 3.x Versions prior to 3.3.8.1 are affected.

IMPACT:

Successful exploitation allows malicious people to conduct cross-site scripting attacks.

SOLUTION:

Update to Version 3.3.8.1 or 2.11.11.1 to resolve this issue.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PMASA-2010-8 (PhpMyAdmin 3.3.8.1)

3 PhpMyAdmin Multiple Vulnerabilities (PMASA-2010-9, PMASA-2010-10)

port 80/tcp

QID: 12473
Category: CGI
Associated CVEs: [CVE-2010-4480](#), [CVE-2010-4481](#)
Vendor Reference: [PMASA-2010-9](#), [PMASA-2010-10](#)
Bugtraq ID: 45633
Service Modified: 01/17/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PhpMyAdmin is a free software tool written in PHP intended to handle the administration of MySQL over the Internet. PhpMyAdmin is prone to the following vulnerabilities:

phpMyAdmin fails to validate BBcode tags in user input of error.php (CVE-2010-4480)

Unauthenticated user is able to display phpinfo output if phpMyAdmin was enabled to show it. (CVE-2010-4481)

PhpMyAdmin Versions prior to 3.4.0-beta1 are affected.

IMPACT:

The vulnerability allows remote attackers to conduct cross-site scripting attacks via a crafted BBcode tag containing @ characters and to bypass authentication and obtain sensitive information via a direct request to phpinfo.php, which calls the phpinfo function

SOLUTION:

Update to Version 3.4.0-beta1 to resolve this issue.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PMASA-2010-9 (PhpMyAdmin 3.4.0-beta1)

3 PHP Hashtables Denial of Service

port 80/tcp

QID: 12539
Category: CGI
Associated CVEs: [CVE-2011-4885](#)
Vendor Reference: -
Bugtraq ID: 51193
Service Modified: 09/02/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is exposed to remote denial of service issue due to the lack of sufficient limits for the number of parameters in POST requests in conjunction with the predictable collision properties in the hashing functions.

Affected Versions:
PHP versions prior to 5.3.9 are affected.

IMPACT:

By exploiting this vulnerability, remote attackers can cause a denial of service (CPU consumption) by sending many crafted HTTP requests.

SOLUTION:

There are no official vendor-supplied patches at this time.

Workaround:

Update to development version of 5.3.9 or 5.4 which supports max_input_vars directive to prevent attacks based on hash collisions. For more information, please refer to the PHP SVN site (<http://svn.php.net/viewvc?view=revision&revision=321040>).

Another method is to reduce the CPU time that a request is allowed to take. For PHP, this can be configured using the max_input_time parameter.

3 PHP Multiple Arbitrary File Access Vulnerabilities

port 80/tcp

QID: 12752
Category: CGI
Associated CVEs: [CVE-2013-1643](#)
Vendor Reference: [PHP 5.3.22, PHP 5.4](#)
Bugtraq ID: 58224,58766
Service Modified: 08/05/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is suited for web development and can be embedded in HTML.

PHP is exposed to multiple arbitrary file disclosure vulnerabilities that allow an attacker to read, write or modify arbitrary files via soap_xmlParseFile and soap_xmlParseMemory functions in SOAP WSDL file.

Affected Versions:
PHP Versions before 5.3.22 and
PHP Versions 5.4.0 prior to 5.4.13

IMPACT:

An authenticated attacker can exploit these vulnerabilities to access or modify arbitrary files within the context of the affected application.

SOLUTION:

Upgrade to PHP 5.3.22 or PHP 5.4.13 or later. For more details about release notes and patches please refer to PHP Portal (<http://www.php.net/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.4.13 (<http://git.php.net/?p=php-src.git;a=blob;f=NEWS;h=36f6f9a4396d3034cc903a4271e7fdeccc5d3ea6;hb=refs/heads/PHP-5.4>)

3 phpMyAdmin Multiple Vulnerabilities (PMASA-2009-2,PMASA-2009-3)

port 80/tcp

QID: 12770
Category: CGI
Associated CVEs: [CVE-2009-1150](#), [CVE-2009-1151](#)
Vendor Reference: [PMASA-2009-2](#)
Bugtraq ID: 34236,34251
Service Modified: 11/01/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PhpMyAdmin is a free software tool written in PHP and intended to handle the administration of MySQL over the Internet.

PhpMyAdmin is affected by multiple security vulnerabilities:

- Input passed via export page cookies is not properly sanitized before being returned to the user. This can be exploited to execute arbitrary HTML and script code in a user's browser session in the context of an affected site.
- The vulnerability is caused due to the application not properly sanitizing configuration parameters during the setup procedure. This can be exploited to inject arbitrary PHP code into the phpMyAdmin configuration file.

Affected Versions:

PhpMyAdmin 2.11.x versions before 2.11.9.5. and 3.x versions before 3.1.3.1.

IMPACT:

Successful exploitation of this vulnerability will allow a remote attacker to gain system access or inject scripts.

SOLUTION:

Vendor has confirmed the vulnerability and a patch has been released. Users are advised to upgrade to the latest version available. For more details about product and patches please refer to advisories PMASA-2009-2 (http://www.phpmyadmin.net/home_page/security/PMASA-2009-2.php), PMASA-2009-3 (http://www.phpmyadmin.net/home_page/security/PMASA-2009-3.php).

3 PHP Denial of Service Vulnerability

port 80/tcp

QID: 12808
Category: CGI
Associated CVEs: [CVE-2013-6712](#)
Vendor Reference: [PHP](#)
Bugtraq ID: 64018
Service Modified: 01/13/2014
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

PHP is a general purpose scripting language that is suited for web development and can be embedded in HTML.

PHP is exposed to a denial of service vulnerability as it fails to properly restrict creation DateInterval objects used in scan function in ext/date/lib/parse_iso_intervals.c which can allow remote attackers to cause a denial of service (heap-based buffer over-read) via a crafted interval specification.

Affected Versions:
Versions prior to PHP 5.5.6

IMPACT:

Successful exploitation of this vulnerability will allow a remote attacker to cause a denial of service.

SOLUTION:

Users are advised to upgrade to the latest version of PHP available. For more details about PHP releases and patches please visit PHP Homepage (<http://www.php.net/>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

PHP (<http://php.net/downloads.php>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Date: Thu, 23 Jul 2026 07:20:58 GMT

3 PHP Denial of Service and Code Execution Vulnerability

port 80/tcp

QID: 13085
Category: CGI
Associated CVEs: [CVE-2014-8626](#), [CVE-2014-9425](#), [CVE-2014-9426](#), [CVE-2014-9427](#)
Vendor Reference: [PHP_ 68618](#), [PHP_ 68676](#)
Bugtraq ID: 71800,71833,70928
Service Modified: 10/30/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

Multiple security vulnerabilities have been confirmed in PHP which can be leveraged by an attacker to execute arbitrary code, leak sensitive information or cause a denial of service.

- mmap in sapi/cgi/cgi_main.c in the CGI component in PHP when used to read a .php file, does not properly consider the mapping's length during processing of an invalid file that begins with a # character and lacks a newline character, which causes an out-of-bounds read.
- apprentice_load function in libmagic/apprentice.c in the Fileinfo component in PHP attempts to perform a free operation on a stack-based character array which can be leveraged to cause a denial of service.
- Double free vulnerability in the zend_ts_hash_graceful_destroy function in zend_ts_hash.c in the Zend Engine in PHP can be leveraged to cause a denial of service.
- Stack-based buffer overflow in the date_from_ISO8601 function in ext/xmlrpc/libxmlrpc/xmlrpc.c in PHP can be leveraged to cause a denial of service.

Affected Version:
PHP 5.5.x through 5.5.20, 5.6.x through 5.6.4 and prior versions to 5.4.36

IMPACT:

Successful exploitation of this vulnerability will allow an attacker to execute arbitrary code, gain access to sensitive information or cause a denial of service.

SOLUTION:

The vendor has confirmed the vulnerability, but no patch is available as of now, however vendor has released fixes for these vulnerabilities via snapshots/ revisions.

Workaround: For more information regarding snapshot/revision download please visit PHP
(<https://bugs.php.net/bug.php?id=68618>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

Reference: CVE-2014-9427

Description: sapi/cgi/cgi_main.c in the CGI component in PHP through 5.4.36, 5.5.x through 5.5.20, and 5.6.x through 5.6.4, when mmap is used to read a .php file, does not properly consider the mapping's length during processing of an invalid file that begins with a # character and lacks a newline character, which causes an out-of-bounds read and might (1) allow remote attackers to obtain sensitive information from php-cgi process memory by leveraging the ability to upload a .php file or (2) trigger unexpected

Link: <https://bugs.php.net/bug.php?id=68618>

Reference: CVE-2014-8626

Description: Stack-based buffer overflow in the date_from_ISO8601 function in ext/xmlrpc/libxmlrpc/xmlrpc.c in PHP before 5.2.7 allows remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code by including a timezone field in a date, leading to improper XML-RPC encoding.

3 PHP Arbitrary Code Execution Vulnerability

port 80/tcp

QID:	13818
Category:	CGI
Associated CVEs:	CVE-2018-19520
Vendor Reference:	CVE-2018-19520
Bugtraq ID:	-
Service Modified:	02/29/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

Multiple vulnerabilities have been discovered in PHP:

Affected Version:
PHP 5.x through 5_6_38

IMPACT:

An issue was discovered in SDCMS 1.6 with PHP 5.x. `app/admin/controller/themecontroller.php` uses a `check_bad` function in an attempt to block certain PHP functions such as `eval`, but does not prevent use of `preg_replace 'e'` calls, allowing users to execute arbitrary code by leveraging access to admin template management.

SOLUTION:

The vendor has advised to update PHP to version 5_6_39 or latest version.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

PHP 5.6.39 (https://www.php.net/releases/5_6_39.php)

COMPLIANCE:

3 Hypertext Preprocessor (PHP) Multiple Security Vulnerabilities (81726, 81727) port 80/tcp

QID: 38881
 Category: General remote services
 Associated CVEs: [CVE-2022-31628](#), [CVE-2022-31629](#)
 Vendor Reference: [81726](#), [81727](#)
 Bugtraq ID: -
 Service Modified: 02/29/2024
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

PHP is a programming language originally designed for use in web-based applications with HTML content. PHP supports a wide variety of platforms and is used by numerous web-based software applications.

Affected versions of PHP has multiple vulnerabilities:

CVE-2022-31628 : The vulnerability exists due to infinite loop within the phar uncompressor code when processing "quines" gzip files. A remote attacker can pass a specially crafted archive to the application, consume all available system resources and cause denial of service conditions.

CVE-2022-31629: The vulnerability exists due to the way PHP handles HTTP variable names. A remote attacker can set a standard insecure cookie in the victim's browser which is treated as a '__Host-' or '__Secure-' cookie by PHP applications.

Affected Versions:

PHP versions before 7.4.31

PHP versions 8.0.0 prior to 8.0.24

PHP versions 8.1.0 prior to 8.1.11

IMPACT:

Successful exploitation of this vulnerability allows a remote attacker to perform a denial of service (DoS) attack or bypass implemented security restrictions.

SOLUTION:

Customers are advised to upgrade to the latest version of PHP. (<https://www.php.net/downloads.php>)
 For more information please refer to Sec Bug 81726 (<https://bugs.php.net/bug.php?id=81726>) and Sec Bug 81727 (<https://bugs.php.net/bug.php?id=81727>) .

page 319

Apache HTTP Server is exposed to following vulnerabilities:

- Crash in ErrorDocument 400 handling (CVE-2015-0253).
- HTTP request smuggling attack against chunked request parser (CVE-2015-3183).
- ap_some_auth_required API unusable (CVE-2015-3185).
- Crash in websockets PING handling (CVE-2015-0228)

Affected Versions:

Apache HTTP Server versions 2.4.x prior to 2.4.16 are affected.

Apache HTTP Server versions 2.2.x prior to 2.2.31 are affected.

IMPACT:

Successfully exploiting these vulnerabilities might allow a remote attacker to bypass intended access restrictions or cause denial of service.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to Apache [httpd 2.4.16 Changelog](http://httpd.apache.org/security/vulnerabilities_24.html) (http://httpd.apache.org/security/vulnerabilities_24.html) and Apache [httpd 2.2.31 Changelog](http://httpd.apache.org/security/vulnerabilities_22.html) (http://httpd.apache.org/security/vulnerabilities_22.html) or your Linux distro for further details.

Patch:

Category:	Web server
Associated CVEs:	CVE-2007-6420 , CVE-2008-2364
Vendor Reference:	Apache httpd 2.2 Vulnerabilities
Bugtraq ID:	29653,27236,31681
Service Modified:	08/03/2023
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Two vulnerabilities have been reported in Apache versions prior to version 2.2.9 and 2.0.64:

- 1) The `mod_proxy_balancer` provides an administrative interface that could be vulnerable to Cross-Site Request Forgery (CSRF) attacks.
- 2) A flaw was found in the handling of excessive interim responses from an origin server when using `mod_proxy_http`.

IMPACT:

A remote attacker could cause a denial of service (DoS) condition, high memory usage, and conduct Cross-Site Request Forgery (CSRF) attacks on a vulnerable system.

SOLUTION:

Upgrade to the Apache httpd 2.2.9 or later, which is available from the Apache Software Foundation Web site at <http://www.apache.org/> (<http://www.apache.org/>). Refer to Apache httpd 2.2 vulnerabilities (http://httpd.apache.org/security/vulnerabilities_22.html) to obtain additional information.

Upgrade to the Apache httpd 2.0.64 or a supported version of Apache, which is available from the Apache Software Foundation Web site at <http://www.apache.org/> (<http://www.apache.org/>).

For CentOS: Refer to CentOS Advisories CESA-2008:0967 for CentOS 3 x86_64 [httpd](http://lists.centos.org/pipermail/centos-announce/2008-November/015396.html) (<http://lists.centos.org/pipermail/centos-announce/2008-November/015396.html>), CentOS 5 i386 [httpd](http://lists.centos.org/pipermail/centos-announce/2008-November/015399.html) (<http://lists.centos.org/pipermail/centos-announce/2008-November/015399.html>) and CentOS 5 x86_64 [httpd](http://lists.centos.org/pipermail/centos-announce/2008-November/015400.html) (<http://lists.centos.org/pipermail/centos-announce/2008-November/015400.html>) to obtain additional information and patch details.

3 Apache Prior to 2.4.4 and 2.2.24 Multiple Vulnerabilities

port 80/tcp

QID: 87156
Category: Web server
Associated CVEs: [CVE-2012-3499](#), [CVE-2012-4558](#)
Vendor Reference: [Apache httpd 2.2 Vulnerabilities](#), [Apache httpd 2.4 Vulnerabilities](#)
Bugtraq ID: 58165,64758
Service Modified: 08/05/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache HTTP Server is prone to multiple cross-site scripting vulnerabilities because it fails to properly sanitize user-supplied input.

- Various XSS flaws exist due to unescaped hostnames and URIs HTML output in mod_info, mod_status, mod_imagemap, mod_ldap, and mod_proxy_ftp.

- A XSS flaw affects the mod_proxy_balancer manager interface.

Affected Versions:

Apache HTTP Server prior to 2.4.4

Apache HTTP Server prior to 2.2.24

IMPACT:

An attacker may leverage these issues to execute arbitrary HTML and script code in the browser of an unsuspecting user in the context of the affected site. This may let the attacker launch additional attacks.

SOLUTION:

These vulnerabilities have been patched in Apache 2.2.24 and 2.4.4. Refer to Apache httpd 2.4.4 Changelog (http://httpd.apache.org/security/vulnerabilities_24.html) and Apache httpd 2.2.24 Changelog (http://httpd.apache.org/security/vulnerabilities_22.html).

Ubuntu users refer to Ubuntu advisory USN-1765-1 (<http://www.ubuntu.com/usn/usn-1765-1/>) for affected packages and patching details, or update with your package manager.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache 2.2.24 (Apache HTTP Server 2.2.24) (<http://httpd.apache.org/download.cgi>)

Apache 2.4.4 (Apache HTTP Server 2.4.4) (<http://httpd.apache.org/download.cgi>)

COMPLIANCE:

3 Apache HTTP Server Multiple Denial of Service Vulnerabilities

```
port 80/tcp
```

Scan Results

User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache HTTP Server versions before to 2.2.22 are exposed to following vulnerabilities:

- mod_proxy_ajp module is affected by remote denial of service vulnerability (CVE-2012-4557).
- mod_log_config is affected by denial of service vulnerability by sending crafted cookie value if the '%{cookienam}C' log format string is in use (CVE-2012-0021).

Affected Products:

Apache HTTP Server prior to 2.2.22

IMPACT:

Successful exploitation of these issues allow for an attacker to cause a denial of service.

SOLUTION:

Upgrade to Apache HTTP Server version 2.2.22 or above. For more details please refer to vendor advisory : Apache 2.2.22 (http://httpd.apache.org/security/vulnerabilities_22.html#2.2.22)

Patch:

3 Apache Hypertext Transfer Protocol Server (HTTP Server) Denial of Service (DoS) Vulnerability

port 80/tcp

QID: 730218
Category: CGI
Associated CVEs: [CVE-2007-6750](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 07/10/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Apache HTTP Server, commonly referred to as Apache is a freely available Web server.

Apache is vulnerable to a denial of service due to holding a connection open for partial HTTP requests.

Apache Versions 1.x and 2.x prior to version 2.2.15 are vulnerable.

IMPACT:

A remote attacker can cause a denial of service against the Web server which would prevent legitimate users from accessing the site.

Denial of service tools and scripts such as Slowloris takes advantage of this vulnerability.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.2.15 or later. For more information refer to Apache HTTP Server Download page (<https://httpd.apache.org/download.cgi>)

Workaround:- Server-specific recommendations can be found here (<https://community.qualys.com/blogs/securitylabs/2011/11/02/how-to-protect-against-slow-http-attacks>).

- Countermeasures for Apache are described here (http://httpd.apache.org/docs/trunk/misc/security_tips.html#dos).
- Reverse proxies, load balancers and iptables can help to prevent this attack from occurring.
- Adjusting the Timeout Directive (<http://httpd.apache.org/docs/2.2/mod/core.html#timeout>) can also prevent this attack from occurring.
- A new module mod_reqtimeout (http://httpd.apache.org/docs/2.2/mod/mod_reqtimeout.html) has been introduced since Apache 2.2.15 to provide tools for mitigation against these forms of attack.

Also refer to Cert Blog (http://www.cert.org/blogs/certcc/2009/07/slowloris_vs_your_webserver.html) and Slowloris and Mitigations for Apache document (<http://bedagaintthewall.blogspot.com/2011/01/slowloris-and-mitigations-for-apache.html>) for further information.

port 80/tcp

QID:	730846
Category:	CGI
Associated CVEs:	CVE-2016-4975
Vendor Reference:	Apache HTTP Server 2.2.32 , Apache HTTP Server 2.4.25
Bugtraq ID:	-
Service Modified:	12/28/2023
User Modified:	-
Edited:	No
PCI Vuln:	Yes

Affected Versions:
 Apache HTTP Server versions 2.4.1-2.4.23
 Apache HTTP Server versions 2.2.0-2.2.31

SOLUTION:

page 328

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2023-38709: Faulty input validation in the core of Apache allows malicious or exploitable backend/content generators to split HTTP responses.

CVE-2024-24795: HTTP Response splitting in multiple modules in Apache HTTP Server allows an attacker that can inject malicious response headers into backend applications to cause an HTTP desynchronization attack.

Affected Versions:

Apache HTTP Server versions prior to 2.4.59

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache versions respectively.

For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

PCI Vuln: No

THREAT:

A vulnerability has been reported in MySQL, which can be exploited by malicious users to cause denial of service.

The vulnerability is caused due to an error when processing an empty bit-string literal and can be exploited to crash the server via a specially crafted SQL statement.

These MySQL versions are vulnerable:

Version 5.0 before 5.0.66

Version 5.1 before 5.1.26

Version 6.0 before 6.0.6

IMPACT:

Attackers can cause a denial of service.

SOLUTION:

Update to the latest MySQL version from this MySQL Downloads page (<http://dev.mysql.com/downloads/>).

Patch:

Vendor Reference: -
Bugtraq ID: 37297
Service Modified: 05/28/2023
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

MySQL is an open source SQL database available for multiple operating systems.

MySQL is prone to the following remote denial of service vulnerabilities:

- 1) An error related to the handling of certain SELECT statements containing subqueries.
- 2) A failure to preserve unspecified 'null_value' flags when executing statements that use the "GeomFromWKB" function.

Versions prior to MySQL 5.0.88 and 5.1.41 are vulnerable.

IMPACT:

The attacker can exploit these issues to crash the application, denying access to legitimate users.

SOLUTION:

Update to MySQL version 5.0.88 and 5.1.41, which can be downloaded from the MySQL Downloads page (<http://dev.mysql.com/downloads/>).

 3 MySQL "sql/sql_table.cc" CREATE TABLE Security Bypass Vulnerability

port 3306/tcp

QID: 19531
Category: Database
Associated CVEs: [CVE-2008-7247](#)
Vendor Reference: -
Bugtraq ID: 38043
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

MySQL is an open-source SQL database application available for multiple operating platforms.

MySQL is prone to a security-bypass vulnerability because it allows attackers to bypass certain checks when creating a table with certain "DATA DIRECTORY" and "INDEX DIRECTORY" options that are within the MySQL home data directory. This issue occurs when the data home directory contains a symbolic link to a different filesystem.

The following are vulnerable:
MySQL 5.0.x through 5.0.88
MySQL 5.1.x through 5.1.41
MySQL 6.0 (prior to 6.0.9)

IMPACT:

Successful exploits will allow attackers to bypass certain security restrictions.

SOLUTION:

The vendor has released updates to resolve this issue. Update to MySQL version 6.0.9, which can be downloaded from the MySQL Downloads page (<http://dev.mysql.com/downloads/>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

Bug #39277: MySQL (SQL) (<http://dev.mysql.com/downloads/>)

Associated CVEs: -
Vendor Reference: [MySQL 5.1.52 Release Notes](#)
Bugtraq ID: -
Service Modified: 01/24/2017
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

MySQL is an open source SQL database application available for multiple operating platforms.

MySQL is prone to a vulnerability caused by an error in the prepared-statement mode when processing "EXPLAIN" for a "SELECT" from a derived table, which can be exploited to cause a crash.

Affected Versions:
MySQL prior to 5.1.52

IMPACT:

If this vulnerability is successfully exploited, an attacker can cause a denial of service.

SOLUTION:

Update to Version 5.1.52 to resolve this issue. The latest version is available for download from MySQL Web site (<http://www.mysql.com/downloads/>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

MySQL 5.1.52: Windows (<https://dev.mysql.com/downloads/mysql/>)

MySQL 5.1.52: Linux (<https://dev.mysql.com/downloads/mysql/>)

 2 MySQL OpenSSL Server Certificate yaSSL Security Bypass Vulnerability

QID: 19505
 Category: Database
 Associated CVEs: [CVE-2009-4028](#)
 Vendor Reference: [MYSQL 5.1.41](#), [MYSQL 5.0.88](#)
 Bugtraq ID: 37076
 Service Modified: 02/29/2024
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

MySQL is an open-source SQL database available for multiple operating systems.

MySQL is prone to a security bypass vulnerability. This issue occurs because MySQL client that uses OpenSSL fails to check the server certificates presented by a server that uses yaSSL. An attacker can exploit this issue to bypass certain security restrictions.

MySQL 5.0.x and 5.1.x are affected.

IMPACT:

Successfully exploiting this issue will allow attackers to gain access to sensitive information. Information obtained may lead to further attacks.

SOLUTION:

For 5.1.x, the vendor has released 5.1.41 to fix the issue. For 5.0.x, the vendor is planning to release 5.0.88 to fix the issue. Update to MySQL Version 5.1.41, which can be downloaded from the MySQL Downloads page (<http://dev.mysql.com/downloads/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Category: General remote services
Associated CVEs: [CVE-2021-36368](#)
Vendor Reference: [OpenSSH 8.9](#)
Bugtraq ID: -
Service Modified: 08/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

CVE-2021-36368: If a client is using public-key authentication with agent forwarding but without -oLogLevel=verbose, and an attacker has silently modified the server to support the None authentication option, then the user cannot determine whether FIDO authentication is going to confirm that the user wishes to connect to that server, or that the user wishes to allow that server to connect to a different server on the user's behalf.

Affected Versions:

OpenSSH versions prior to 8.9

IMPACT:

Successful exploitation allows a remote attacker silently modify the server to support the None authentication option when a client is using public-key authentication with agent forwarding but without -oLogLevel=verbose.

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.9 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

OpenSSH 8.9 or later (<https://www.openssh.com/>)

2 OpenSSH Probable User Enumeration Vulnerability

QID:	38903
Category:	General remote services
Associated CVEs:	CVE-2016-20012
Vendor Reference:	OpenSSH 8.8
Bugtraq ID:	-
Service Modified:	04/09/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

CVE-2016-20012: OpenSSH through 8.7 allows remote attackers, who have a suspicion that a certain combination of username and public key is known to an SSH server, to test whether this suspicion is correct. This occurs because a challenge is sent only when that combination could be valid for a login session.

Affected Versions:

OpenSSH versions prior to 8.8

IMPACT:

Successful exploitation allows a remote attacker to test and confirm if a certain combination of username and public key is known to an SSH server.

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.8 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

<https://rushter.com/blog/public-ssh-keys/>

Reference: CVE-2016-20012

Description: OpenSSH through 8.7 allows remote attackers, who have a suspicion that a certain combination of username and public key is known to an SSH server, to test whether this suspicion is correct. This occurs because a challenge is sent only when that combination could be valid for a login session. NOTE: the vendor does not recognize user enumeration as a vulnerability for this product

Link:

<https://github.com/openssh/openssh-portable/blob/d0fffc88c8fe90c1815c6f4097bc8cbcabc0f3dd/auth2-pubkey.c#L261-L265>

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

 2 OpenSSH Improper Authorization Vulnerability (CVE-2017-15906)

QID: 38905

Category: General remote services

Associated CVEs: [CVE-2017-15906](#)

Vendor Reference: [OpenSSH 7.6](#)

Bugtraq ID: -
Service Modified: 04/09/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

The process_open function in sftp-server.c in OpenSSH before 7.6 does not properly prevent write operations in readonly mode, which allows attackers to create zero-length files.

Affected Versions:
OpenSSH versions prior to 7.6

IMPACT:

Successful exploitation allows a remote attacker having readonly access to create zero-length files resulting in improper authorization and lack of Integrity.

SOLUTION:

Customers are advised to upgrade to OpenSSH 7.6 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
OpenSSH 7.6 (<https://www.openssh.com/txt/release-7.6>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

2 OpenSSH Expected Behavior Violation Vulnerability (CVE-2025-32728)

QID: 38979
Category: General remote services
Associated CVEs: [CVE-2025-32728](#)
Vendor Reference: [openssh 10.0](#)
Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions: OpenSSH before version 10.0

IMPACT:

Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.

SOLUTION:

Customers are advised to upgrade to OpenSSH 10.0 (<https://www.openssh.com/txt/release-10.0>) or later to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

openssh 10.0 (<https://www.openssh.com/txt/release-10.0>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1 detected on port 22 over TCP.

 2 OpenSSH ForceCommand Bypass Vulnerability

QID:	42375
Category:	General remote services
Associated CVEs:	CVE-2008-1657
Vendor Reference:	OpenSSH 4.9
Bugtraq ID:	28531
Service Modified:	07/18/2020
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH is prone to a security bypass vulnerability caused by an improper implementation of the "ForceCommand" directive. This can be exploited to execute arbitrary commands via the ~/.ssh/rc file even if a "ForceCommand" directive is in effect.

Affected Software:

OpenSSH 4.x Versions prior to 4.9 are affected

IMPACT:

Successful exploitation allows malicious, local users to bypass certain security restrictions.

SOLUTION:

Vendor has released update (OpenSSH 4.9 or later) to resolve this issues.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

OpenSSH 4.9 (<http://www.openssh.com/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSH-2.0-OpenSSH_4.7p1 Debian-8ubuntu1

2 Samba setuid "mount.cifs" Verbose Option Information Disclosure Vulnerability

QID: 70052
Category: SMB / NETBIOS
Associated CVEs: [CVE-2009-2948](#)
Vendor Reference: [Samba](#)
Bugtraq ID: 36572
Service Modified: 10/07/2009
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a file and printer sharing application. Samba allows users to share files and printers between operating systems on Unix and Windows platforms.

Samba is prone to an information disclosure vulnerability because it fails to properly validate access privileges.

Samba Versions prior to 3.4.2, 3.3.8, 3.2.15, and 3.0.37 are vulnerable.

IMPACT:

Successful exploitation of this vulnerability will allow attackers to obtain sensitive information that may aid in further attacks.

SOLUTION:

Workaround:

Clear the setuid bit from mount.cifs. For instance:

```
# chmod u-s /sbin/mount.cifs
```

Impact of the workaround:

This will prevent unprivileged users from mounting CIFS shares.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba Security Advisory (Samba 3.3.12) (<http://www.samba.org/samba/ftp/stable/samba-3.3.12.tar.gz>)

Samba Security Advisory (Samba 3.4.7) (<http://www.samba.org/samba/ftp/stable/samba-3.4.7.tar.gz>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Samba 3.0.20-Debian

2 Samba Symlink Directory Traversal Vulnerability - Zero Day

QID: 70055
Category: SMB / NETBIOS
Associated CVEs: [CVE-2010-0926](#)

Vendor Reference: -
Bugtraq ID: 38111
Service Modified: 09/02/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a file and printer-sharing application that allows users to share files and printers between operating systems on Unix and Windows platforms.

It is prone to a vulnerability that is caused due to Samba allowing the creation of symlinks to directories placed outside a writable share.

Successful exploitation without authentication requires that a public writable share is exported.

Samba Version 3.4.5 and prior are affected.

IMPACT:

This can be exploited to gain read and write access to restricted directories with the privileges of the guest account user, via directory traversal attacks.

SOLUTION:

Patch -

There are no vendor supplied patches available at this time.

Workaround:

In general do not export writable shares to untrusted users.

Samba can be configured to not to follow symbolic links outside of an area designated as being exported as a share point.

Set the wide links parameter of the global section of the smb.conf file to the value no.

Example:

wide links = no

This change may cause performance problems. It is highly recommended to fully test this workaround before implementing in your production environment.

COMPLIANCE:

Not Applicable

2 Samba SWAT Cross-Site Scripting and Request Forgery Vulnerabilities

QID: 70063
Category: SMB / NETBIOS
Associated CVEs: [CVE-2011-2522](#), [CVE-2011-2694](#)
Vendor Reference: [Samba 3.5.10 Release Notes](#)
Bugtraq ID: 48899,48901
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Two vulnerabilities exists in Samba:

1) The Samba Web Administration Tool (SWAT) allows users to perform certain actions via HTTP requests without performing any validity checks to verify the requests.

2) Input passed to the "user" field of the "Change password" page of SWAT is not properly sanitised before being returned to the user. This can be exploited to execute arbitrary HTML and script code in a user's browser session in context of an affected site.

Affected Versions:-
Samba 3.0.x through 3.5.9.

Note:- The remote detection relies only on banner version and does not check for SWAT enabled/disabled. The SWAT feature is tested in authenticated detection, assuming that the swat binary is located in the /usr/sbin directory and has root privileges.

IMPACT:

The vulnerabilities can be exploited by malicious people to conduct cross-site scripting and request forgery attacks. Successful exploitation

of the vulnerabilities requires that SWAT is enabled (not default).

SOLUTION:

Workaround

Ensure SWAT is turned off and configure Samba using an alternative method to edit the smb.conf file.

The vendor has released updates to resolve this issue. Update to Samba 3.5.10 to resolve the issue. Refer to Samba Release Notes 3.5.10 (<http://samba.org/samba/history/samba-3.5.10.html>) to obtain additional details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

2 Apache mod_proxy_ftp 2.0.x/2.2.x Denial of Service Vulnerability

QID: 86854

Category: Web server

Associated CVEs: [CVE-2009-3094](#)

Vendor Reference: -

Bugtraq ID:	36254
Service Modified:	05/03/2021
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Apache `mod_proxy_ftp` is a module for the Apache Web server to handle FTP proxy requests.

A vulnerability exists in `mod_proxy_ftp` which is caused by an error in the module when processing responses received from FTP servers. This can be exploited to trigger a NULL-pointer dereference and crash an Apache child process via a malformed EPSV response.

Successful exploitation requires that a threaded Multi-Processing Module is used and that the `mod_proxy_ftp` module is enabled.

The vulnerability is confirmed in Apache Versions 2.0.63 and 2.2.13. Other versions may also be affected.

IMPACT:

Successful exploitation of this vulnerability can allow an attacker to cause a denial of service.

SOLUTION:

Workaround:

Restrict proxy access to trusted users only.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache 2.2.14: Apache (<http://httpd.apache.org/download.cgi>)

COMPLIANCE:

2 Apache HTTP Server APR-util Multiple Denial of Service Vulnerabilities

QID: 86920
Category: Web server
Associated CVEs: [CVE-2009-3560](#), [CVE-2009-3720](#), [CVE-2010-1623](#)
Vendor Reference: [Apache HTTP Server 2.2](#)
Bugtraq ID: 37203,43673
Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Apache HTTP Server is a freely available Web server.

Apache Server is prone to the following vulnerabilities:

- Two XML parsing vulnerabilities exist in the Apache HTTP Server.
- An error within the "apr_brigade_split_line()" function in buckets/apr_brigade.c can be exploited to cause high memory consumption.

Apache HTTP Server versions prior to 2.2.17 are affected.

Apache HTTP Server versions prior to 2.0.64 are also affected.

IMPACT:

Successful exploitation allows malicious users to cause a denial of service.

SOLUTION:

The vendor has released Apache HTTP Server Version 2.2.17 and version 2.0.64 to resolve these issues.
The latest version is available for download from Apache Web site (<http://httpd.apache.org/>)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache 2.2.17: Apache 2.2.x (HTTP) (<http://httpd.apache.org/download.cgi>)

Associated CVEs:	CVE-2011-3181
Vendor Reference:	PMASA-2011-13
Bugtraq ID:	49306
Service Modified:	04/30/2012
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

phpMyAdmin is a free software tool written in PHP intended to handle the administration of MySQL over the Internet. Certain input passed to table, column and index names is not properly sanitized before being used in the Tracking feature.

Affected Versions:
phpMyAdmin versions 3.3.0 through 3.4.3.2.

IMPACT:

This vulnerability can be exploited by malicious users to conduct script insertion attacks by inserting arbitrary HTML and script code, which will be executed in a user's browser session in the context of an affected site when the malicious data is being viewed..

SOLUTION:

The vendor has released a patch (phpMyAdmin Version 3.3.10.4 or 3.4.4 or later) to resolve these issues. Refer to Vendor advisory PMASA-2011-13 (http://www.phpmyadmin.net/home_page/security/PMASA-2011-13.php) to address this issue and obtain further details.

Patch:
Following are links for downloading patches to fix the vulnerabilities:

PMASA-2011-13 (phpMyAdmin 3.4.4)
(<http://sourceforge.net/projects/phpmyadmin/files/phpMyAdmin/3.4.4/phpMyAdmin-3.4.4-all-languages.zip/download>)

PMASA-2011-13 (phpMyAdmin 3.3.10.4)
(<http://sourceforge.net/projects/phpmyadmin/files/phpMyAdmin/3.3.10.4/phpMyAdmin-3.3.10.4-all-languages.zip/download>)

2 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.68 Security Vulnerabilities (CVE-2026-29170)

port 80/tcp

QID:	734375
Category:	CGI
Associated CVEs:	CVE-2026-29170
Vendor Reference:	Apache_HTTP_Server_2.4.68
Bugtraq ID:	-
Service Modified:	06/19/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2026-29170: mod_proxy_ftp XSS

Affected Versions:
Apache httpd 2.4.x before 2.4.68

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

2 Database Instance Detected

port 5432/tcp

QID: 19568
Category: Database
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 12/03/2019
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The service detected a database installation on the target. Databases like Oracle, MS-SQL, MySQL, IBM DB2, PostgreSQL, Firebird and others are detected. The database instance is listed in the result section below.

IMPACT:

Information disclosing database type will lead attacker to perform more targeted attacks.

SOLUTION:

Users are recommended to encrypt the database information and handle the situations where any error is leading to disclose some sensitive information like database type and its version.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

POSTGRESQL instance detected on TCP port 5432.

2 Deprecated Public Key Length

port 5432/tcp over SSL

QID:	38598
Category:	General remote services
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	09/13/2025
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

NIST has a special publication SP800-131A (<http://csrc.nist.gov/publications/nistpubs/800-131A/sp800-131A.pdf>) in which it has several recommendation regarding cryptographic algorithm and key length use. The recommendation for key length is:

- key lengths less than 1024 bits

are disallowed, which means they are considered weak and should not be used.

- key lengths between 1024 bits and 2047 bits are

deprecated

- key lengths 2048 and more are approved and safe to use.

IMPACT:

A key should be large enough that a brute force attack is infeasible - i.e., would take too long to execute.

SOLUTION:

Please obtain a 2048 bit or more public key length certificate from your Certificate Authority.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

2 MySQL XPath Scalar Expression Handling Denial of Service Vulnerability

port 3306/tcp

QID: 19335
Category: Database
Associated CVEs: [CVE-2009-0819](#)
Vendor Reference: [MYSQL UPDATE](#)
Bugtraq ID: 33972
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

MySQL is a relational database management system.

A denial of service vulnerability exists in MySQL which is caused by an error when processing malformed XPath expressions. This issue can be exploited to crash an affected server by invoking the "ExtractValue()" or "UpdateXML()" functions using a specially-crafted XPath expression containing scalar FilterExp expressions.

MySQL Versions 5.x prior to 5.1.32 are affected with this issue.

IMPACT:

If this vulnerability is successfully exploited, it will allow attackers to crash the affected server, denying access to legitimate users.

SOLUTION:

The vendor has released MySQL Version 5.1.32 to resolve this issue. The new version is available at the MySQL Download Web site (<http://dev.mysql.com/downloads/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

MySQL 5.1.32: MySQL (<http://dev.mysql.com/doc/refman/5.1/en/news-5-1-32.html>)

COMPLIANCE:

2 MySQL Prior to Version 5.1.49 Multiple Security Issues

port 3306/tcp

QID: 19585
Category: Database
Associated CVEs: -
Vendor Reference: [MySQL 5.1.49 Release Notes](#)
Bugtraq ID: -
Service Modified: 11/02/2015
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

MySQL is an open source SQL database application available for multiple operating platforms. MySQL is prone to the following vulnerabilities:

- 1) An error within the handling of DDL statements after having changed the "innodb_file_per_table" or "innodb_file_format" configuration parameters can be exploited to crash the server.
- 2) An error when handling joins involving a unique "SET" column can be exploited to crash the server.
- 3) An error when handling NULL arguments passed to "IN()" or "CASE" operations can be exploited to crash the server.
- 4) An error when processing certain malformed arguments passed to the "BINLOG" statement can be exploited to crash the server.
- 5) An error when processing "TEMPORARY" InnoDB tables featuring nullable columns can be exploited to crash the server.
- 6) An error when performing alternating reads from two indexes on tables using the "HANDLER" interface can be exploited to crash the server.
- 7) An error when handling "EXPLAIN" statements on certain queries can be exploited to crash the server.
- 8) An error when handling "LOAD DATA INFILE" statements can lead to the return of an "OK" packet although errors have been encountered.

MySQL 5.x prior to 5.1.49 are affected.

IMPACT:

Successful exploitation allows a local attacker to cause denial of service to legitimate users.

SOLUTION:

The vendor released an updated version (MySQL 5.1.49) to fix this issue. Refer to MySQL 5.1.49 Release Notes (<http://lists.mysql.com/mysql/222318>) for more information.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

MySQL 5.1.49 (MySQL) (<http://dev.mysql.com/downloads/mysql/>)

5.0.51a-3ubuntu5

2 MySQL Prior to Version 5.1.51 Multiple Denial Of Service Vulnerabilities

port 3306/tcp

QID: 19588
Category: Database
Associated CVEs: [CVE-2010-3833](#), [CVE-2010-3834](#), [CVE-2010-3835](#), [CVE-2010-3836](#), [CVE-2010-3837](#), [CVE-2010-3838](#), [CVE-2010-3839](#), [CVE-2010-3840](#)
Vendor Reference: -
Bugtraq ID: 43676, 43677
Service Modified: 11/09/2011
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

MySQL is an open source SQL database application available for multiple operating platforms.

MySQL is prone to the following vulnerabilities:

- 1) An error in the processing of arguments passed to e.g. the "LEAST()" or "GREATEST()" function can be exploited to cause the server to crash.
- 2) An error when materializing a derived table that requires a temporary table for grouping can be exploited to cause the server to crash.
- 3) An error due to the re-evaluation of expression values used for temporary tables can be exploited to cause the server to crash.
- 4) An error in the handling of the "GROUP_CONCAT()" statement in combination with "WITH ROLLUP" can be exploited to cause the server to crash.
- 5) An error within the handling of the "GREATEST()" or "LEAST()" functions when using an intermediate temporary table can be exploited to cause a crash by passing a mixed list of numeric and "LONGBLOB" arguments to the affected functions.
- 6) An error in the processing of nested joins in stored procedures and prepared statements can be exploited to cause an infinite loop.

MySQL Versions prior to 5.1.51 are affected.

IMPACT:

Successful exploitation allows malicious users to cause a denial of service.

SOLUTION:

The vendor released an updated version (MySQL 5.1.51) to fix this issue. Refer to MySQL 5.1.51 Release Notes (<http://dev.mysql.com/doc/refman/5.1/en/news-5-1-51.html>) for more information.

 3 Remote Access or Management Service Detected

QID: 42017
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/20/2024

User Modified: -
Edited: No
PCI Vuln: No

THREAT:

A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:

Consequences vary by the type of attack.

SOLUTION:

Expose the remote access or remote management services only to the system administrators or intended users of the system.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Service name: SSH on TCP port 22.
Service name: TFTP on UDP port 69.
Service name: FTP on TCP port 21.
Service name: Telnet on TCP port 23.
Service name: Rlogin TCP port 513.
Service name: SHELL on TCP port 1524.

3 FTP-Service Anonymous-Logon Information Gathering

3 NetBIOS Bindings Information

QID: 70004
Category: SMB / NETBIOS
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/09/2005

User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The following bindings were detected on this computer. Bindings have many purposes. They reflect such things as users logged-in, registration of a user name, registration of a service in a domain, and registering of a NetBIOS name.

IMPACT:

Unauthorized users can use this information in further attacks against the host. A list of logged-in users on the target host/network can potentially be used to launch social engineering attacks.

SOLUTION:

This service uses the UDP and TCP port 137. Typically, this port should not be accessible to external networks, and should be firewalled.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

2 Operating System Detected

QID: 45017
Category: Information gathering

Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 07/08/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) TCP/IP Fingerprint: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) NetBIOS: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) PHP Info: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) SNMP: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB-II.system.sysDescr" for the operating system.

2 STAT FTP Command Information Disclosure

port 21/tcp

QID: 27003
Category: File Transfer Protocol
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: 1506
Service Modified: 05/05/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

"STAT" is a command of the FTP protocol. It discloses an excessive amount of information about the state of the current server.

Note: This QID may be associated with CVE-2000-0646.

IMPACT:

Unauthorized users can exploit this command to obtain information about the FTP server, such as the number of users currently using it, the length of time it's been running, whether the unauthorized user is likely to be discovered by an Administrator, etc.

SOLUTION:

Patch -

Upgrade to the latest version of WFTPD (2.4.1RC12 or later), available from the WFTPD Web site (<http://www.wftpd.com/downloads.htm>).

Workaround: If your FTP server software allows you to, disable this command.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

211-FTP server status:
Connected to 172.30.0.2
Logged in as ftp
TYPE: ASCII
No session bandwidth limit
Session timeout in seconds is 300
Control connection is plain text
Data connections will be plain text
vsFTPD 2.3.4 - secure, fast, stable
211 End of status

2 FTP Server Banner

port 21/tcp

QID: 27113
Category: File Transfer Protocol

Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 04/30/2019
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The following message is shown to all users logging on to your FTP server, including anonymous logins if they are allowed on your server.

IMPACT:

Unauthorized users can obtain sensitive information about your server, such as the version or type of server you are running, and use this information to implement specific attacks against the server.

SOLUTION:

If possible, edit the configuration files or recompile the server to restrict the type of information disclosed.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

220 (vsFTPD 2.3.4)

2 Web Applications and Plugins Detected

port 80/tcp

QID: 45114
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/24/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The result section of this QID lists web applications and plugins that were detected on the target using web application fingerprinting. This technique compares static files at known locations against precomputed hashes for versions of those files in all available releases. The technique is fast, low-bandwidth, non-invasive, generic, and highly automatable.

Following open source and free applications are currently supported:

 1 Host Scan Time - Scanner

QID: 45038
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/15/2022
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

tmp	oh noes!	Anonymous access

1 Open UDP Services List

QID: 82004
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 07/11/2005
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

A port scanner was used to draw a map of all the UDP services on this host that can be accessed from the Internet.

Note that if the host is behind a firewall, there is a small chance that the list includes a few ports that are filtered or blocked by the firewall but are not actually open on the target host. This (false positive on UDP open ports) may happen when the firewall is configured to reject UDP packets for most (but not all) ports with an ICMP Port Unreachable packet. This may also happen when the firewall is configured to allow UDP packets for most (but not all) ports through and filter/block/drop UDP packets for only a few ports. Both cases are uncommon.

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty working out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Port	IANA Assigned Ports/Services	Description	Service Detected
69	tftp	Trivial File Transfer	tftp
137	netbios-ns	NETBIOS Name Service	netbios ns
138	netbios-dgm	NETBIOS Datagram Service	unknown

1 Open TCP Services List

QID: 82023
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -

Bugtraq ID: -
Service Modified: 11/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

1 ICMP Replies Received

QID: 82040
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/16/2003
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)

Timestamp Request (to trigger Timestamp Reply)

Address Mask Request (to trigger Address Mask Reply)

UDP Packet (to trigger Port Unreachable Reply)

IP Packet with Protocol ≥ 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Average change between subsequent TCP initial sequence numbers is 871558747 with a standard deviation of 623518892. These TCP initial sequence numbers were triggered by TCP SYN probes sent to the host at an average rate of 1/(5058 microseconds). The degree of difficulty to exploit the TCP initial sequence number generation scheme is: hard.

1 IP ID Values Randomness

QID:	82046
Category:	TCP/IP
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	07/27/2006
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The values for the identification (ID) field in IP headers in IP packets from the host are analyzed to determine how random they are. The changes between subsequent ID values for either the network byte ordering or the host byte ordering, whichever is smaller, are displayed in the RESULT section along with the duration taken to send the probes. When incremental values are used, as is the case for TCP/IP implementation in many operating systems, these changes reflect the network load of the host at the time this test was conducted.

Please note that for reliability reasons only the network traffic from open TCP ports is analyzed.

1 Enumerate Windows shares that are readable by Everyone and count files

QID: 90635
Category: Windows
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/07/2021
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Refer to the RESULTS section for a list of Windows shares that are readable by Everyone and optional counting of the number of files in each share.

Columns in RESULTS section:

The Share column shows the share name.

The Path column shows the path to the share.

The Files column shows the number of files found in each share.

The Writable column indicates whether all the files in each share are writable by Everyone (Yes/No).

The Comments section refers to optional counting of files in the share if the Dissolvable Agent is enabled.

In the Comments column "OK" indicates that the scanning engine finished counting the files in the share. "Limited" indicates that the scanning engine either a) reached its time limit before finishing the file count, or b) reached its maximum number of files to count, or c) failed to count files at all. If Comments is "Limited", this could also imply the number of files in Files may be less than the actual value. "Count skipped" indicates that counting of files wasn't attempted because the Dissolvable Agent is not enabled.

 1 Telnet Banner

port 23/tcp

QID:	38007
Category:	General remote services
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	04/25/2018
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Telnet banner sometimes provides excessive information about the host.

IMPACT:

If sensitive information is disclosed by the telnet banner, unauthorized users may be able to determine the type of Operating System this host is running, the host name, the domain name and possibly even the name of the Administrator.

SOLUTION:

Do not disclose sensitive information through the telnet banner. Use an encrypted remote session service if available. You might also put a legal advisory on the telnet banner stating:

1. Only authorized persons can connect.
2. All attack attempts will be prosecuted.
3. All

connections are logged.

1 HTTP method TRACE and/or TRACK Enabled

port 80/tcp

QID: 45033
 Category: Information gathering
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 05/27/2005
 User Modified: -
 Edited: No
 PCI Vuln: No

THREAT:

The target Web server supports the TRACE and/or TRACK HTTP methods. These methods allow debugging and connection trace analysis for connections from the client to the Web server. Per the HTTP specification, when this method is used, the Web server echoes back the information sent to it by the client unmodified and unfiltered. Microsoft IIS Web server uses an alias TRACK for the TRACE method, and is functionally the same.

The exact method(s) used are shown in the Results section.

IMPACT:

1 Referrer-Policy HTTP Security Header Not Detected

port 80/tcp

QID: 48131
Category: Information gathering
Associated CVEs: -
Vendor Reference: [Referrer-Policy](#)
Bugtraq ID: -
Service Modified: 01/18/2023
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

- 1) no-referrer
- 2) no-referrer-when-downgrade
- 3) same-origin
- 4) origin
- 5) origin-when-cross-origin
- 6) strict-origin
- 7) strict-origin-when-cross-origin

IMPACT:

The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:

Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

 1 Web Server Supports HTTP Request Pipelining

port 80/tcp

QID:	86565
Category:	Web server
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	02/22/2005
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:

Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker (<http://www.defcon.org/images/defcon-11/dc-11-presentations/dc-11-Roelker/dc-11-roelker-paper.pdf>), it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Splitting style attacks.

SOLUTION:

1 SSH daemon information retrieving

port 22/tcp

QID: 38047
Category: General remote services
Associated CVEs: -

Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 09/20/2024
 User Modified: -
 Edited: No
 PCI Vuln: No

THREAT:

SSH is a secure protocol, provided it is fully patched, properly configured, and uses FIPS approved algorithms.
 Supported ciphers suites reported in this qid are in server-preferred order.

For Red Hat ES 4:-

SSH1 supported	yes
Supported authentication methods for SSH1	RSA,password
Supported ciphers for SSH1	3des,blowfish
SSH2 supported	yes
Supported keys exchange algorithm for SSH2	diffie-hellman-group-exchange-sha1,diffie-hellman-group14-sha1,diffie-hellman-group1-sha1
Supported decryption ciphers for SSH2	aes128-cbc,3des-cbc,blowfish-cbc,cast128-cbc,arcfour,aes192-cbc,aes256-cbc,rijndael-cbc@lysator.liu.se,aes128-ctr,aes192-ctr,aes256-ctr
Supported encryption ciphers for SSH2	aes128-cbc,3des-cbc,blowfish-cbc,cast128-cbc,arcfour,aes192-cbc,aes256-cbc,rijndael-cbc@lysator.liu.se,aes128-ctr,aes192-ctr,aes256-ctr
Supported decryption mac for SSH2	hmac-md5,hmac-sha1,hmac-ripemd160,hmac-ripemd160@openssh.com,hmac-sha1-96,hmac-md5-96
Supported encryption mac for SSH2	hmac-md5,hmac-sha1,hmac-ripemd160,hmac-ripemd160@openssh.com,hmac-sha1-96,hmac-md5-96
Supported authentication methods for SSH2	publickey,gssapi-with-mic,password

IMPACT:

Successful exploitation allows an attacker to execute arbitrary commands on the SSH server or otherwise subvert an encrypted SSH channel with arbitrary data.

SOLUTION:

SSH version 2 is preferred over SSH version 1.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSH1 supported	no
SSH2 supported	yes
Supported key exchange algorithms for SSH2	diffie-hellman-group-exchange-sha256, diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, diffie-hellman-group1-sha1
Supported host key algorithms for SSH2	ssh-rsa, ssh-dss
Supported decryption ciphers for SSH2	aes128-cbc, 3des-cbc, blowfish-cbc, cast128-cbc, arcfour128, arcfour256, arcfour, aes192-cbc, aes256-cbc, rijndael-cbc@lysator.liu.se, aes128-ctr, aes192-ctr, aes256-ctr
Supported encryption ciphers for SSH2	aes128-cbc, 3des-cbc, blowfish-cbc, cast128-cbc, arcfour128, arcfour256, arcfour, aes192-cbc, aes256-cbc, rijndael-cbc@lysator.liu.se, aes128-ctr, aes192-ctr, aes256-ctr
Supported decryption macs for SSH2	hmac-md5, hmac-sha1, umac-64@openssh.com, hmac-ripemd160, hmac-ripemd160@openssh.com, hmac-sha1-96, hmac-md5-96
Supported encryption macs for SSH2	hmac-md5, hmac-sha1, umac-64@openssh.com, hmac-ripemd160, hmac-ripemd160@openssh.com, hmac-sha1-96, hmac-md5-96
Supported decompression for SSH2	none, zlib@openssh.com

1 SSL Session Caching Information

port 5432/tcp over SSL

QID: 38291
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 03/19/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

SSL session is a collection of security parameters that are negotiated by the SSL client and server for each SSL connection. SSL session caching is targeted to reduce the overhead of negotiations in recurring SSL connections. SSL sessions can be reused to resume an earlier connection or to establish multiple simultaneous connections. The client suggests an SSL session to be reused by identifying the session with a Session-ID during SSL handshake. If the server finds it appropriate to reuse the session, then they both proceed to secure communication with already known security parameters.

This test determines if SSL session caching is enabled on the host.

IMPACT:

SSL session caching is part of the SSL and TLS protocols and is not a security threat. The result of this test is for informational purposes only.

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSLv3 session caching is disabled on the target.
TLSv1 session caching is enabled on the target.

**1 Secure Sockets Layer/Transport Layer Security (SSL/TLS) Invalid Protocol Version Tolerance**

PCI Vuln: No

THREAT:

Diffie-Hellman is a popular cryptographic algorithm used by SSL/TLS.

- For fixed primes: 1024 and below are considered unsafe.

- For variable

primes: 512 is unsafe. 768 is probably mostly safe, but might not be for long. 1024 and above are considered safe.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSL server default to use Diffie-Hellman key exchange method with variable 1024(bits) prime

1 Secure Sockets Layer/Transport Layer Security (SSL/TLS) Key Exchange Methods

1 Secure Sockets Layer/Transport Layer Security (SSL/TLS) Protocol Properties

port 5432/tcp over SSL

QID: 38706
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/09/2021
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The following is a list of detected SSL/TLS protocol properties.

IMPACT:

Items include:

Extended Master Secret: indicates whether the extended_master_secret extension is supported or required by the server. This extension enhances security and is recommended. Applicable to TLSv1, TLSv1.1, TLSv1.2, DTLSv1, DTLSv1.2
Encrypt Then MAC: indicates whether the encrypt_then_mac extension is supported or required by the server. This extension enhances the security of non-AEAD ciphers and is recommended. Applicable to TLSv1, TLSv1.1, TLSv1.2, DTLSv1, DTLSv1.2
Heartbeat: indicates whether the heartbeat extension is supported. It is not recommended to enable this, except for DTLS. Applicable to TLSv1, TLSv1.1, TLSv1.2, TLSv1.3, DTLSv1, DTLSv1.2
Truncated HMAC: indicates whether the truncated_hmac extension is supported. This can degrade security and is not recommended. Applicable to TLSv1, TLSv1.1, TLSv1.2, DTLSv1, DTLSv1.2
Cipher priority: indicates whether client, server or both determine the priority of ciphers. Having the server determine the priority is recommended. Applicable to SSLv3, TLSv1, TLSv1.1, TLSv1.2, TLSv1.3, DTLSv1, DTLSv1.2

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

RESULTS:

NAME	STATUS
SSLv3	
Cipher priority controlled by	client
TLSv1	
Extended Master Secret	no
Encrypt Then MAC	no
Heartbeat	no
Truncated HMAC	no
Cipher priority controlled by	client
OCSP stapling	no
SCT extension	no

**1 TLS Secure Renegotiation Extension Support Information**

port 5432/tcp over SSL

QID: 42350
Category: General remote services
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 03/21/2016
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Secure Socket Layer (SSL) and Transport Layer Security (TLS) renegotiation are vulnerable to an attack in which the attacker forms a TLS

connection with the target server, injects content of his choice, and then splices in a new TLS connection from a client. The server treats the client's initial TLS handshake as a renegotiation and thus believes that the initial data transmitted by the attacker is from the same entity as the subsequent client data. TLS protocol was extended to cryptographically tierrenegotiations to the TLS connections they are being performed over. This is referred to as TLS secure renegotiation extension. This detection determines whether the TLS secure renegotiation extension is supported by the server or not.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

TLS Secure Renegotiation Extension Status: supported.

 1 SSL Certificate - Information

port 5432/tcp over SSL

Vulnerabilities (6)

 3 Remote Management Service Accepting Unencrypted Credentials Detected (FTP)

QID:	48169
Category:	Information gathering
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	06/24/2025
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

A remote management service that accepts unencrypted credentials was detected on the target host.
Services like FTP with basic auth are checked.

IMPACT:

NA

SOLUTION:

If possible, use alternate services that provide encryption.
Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Service name: FTP on TCP port 21.

 2 SHA1 deprecated setting for SSH

port 22/tcp

QID:	38909
Category:	General remote services
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	09/05/2025
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The SSH protocol (Secure Shell) is a method for secure remote login from one computer to another.

The target is using deprecated SHA1 cryptographic settings to communicate.

IMPACT:

vulnerable to collision attacks, which are designed to fabricate the same hash value for different input data. each hash is supposedly unique.

SOLUTION:

Avoid using deprecated cryptographic settings.

Use best practices when configuring SSH.

Refer to NIST Retires SHA-1 Cryptographic Algorithm (SSH)

(<https://www.nist.gov/news-events/news/2022/12/nist-retires-sha-1-cryptographic-algorithm>) .

Other documents to refer

Deprecate settings listed for red hat

(https://access.redhat.com/documentation/en-us/red_hat_enterprise_linux/7/html/7.4_release_notes/chap-red_hat_enterprise_linux-7.4_release_note_s-deprecated_functionality_in_rhel7)

Key exchange (<https://www.ietf.org/archive/id/draft-ietf-curdle-ssh-kex-sha2-13.html>)

CBC Cipher (<https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5161>)

SHA1 ietf reference (<https://datatracker.ietf.org/doc/html/rfc9142>)

Settings currently considered deprecated:

1. Key exchange algorithms:

diffie-hellman-group1-sha1, rsa1024sha1, diffie-hellman-group14-sha1, diffie-hellman-group-exchange-sha1, gss-gex-sha1-*, gss-group1-sha1-* and gss-group14-sha1-*

2. MAC:

hmac-sha1, hmac-sha1-96, hmac-sha1-etm@openssh.com, hmac-sha1-96-etm@openssh.com

3. Host key:

ssh-rsa, ssh-dss, ssh-rsa-cert-v01@openssh.com, ssh-dss-cert-v01@openssh.com

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Type	Name
host key algorithm	ssh-rsa
MAC	hmac-sha1-etm@openssh.com
MAC	hmac-sha1

2 Accessible Anonymous FTP Server

port 21/tcp

QID: 27000
Category: File Transfer Protocol
Associated CVEs: [CVE-1999-0497](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/07/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Users can access the FTP server using the "anonymous" or "ftp" account with any password. Some FTP server software is

installed with Anonymous access enabled by default. Vulnerable systems include RedHat Linux installations and Microsoft IIS (Internet Information Server) installations.

IMPACT:

The FTP server may contain sensitive files because anonymous FTP servers are often used to exchange files between different users. These files can be downloaded by anybody who visits this FTP server. Anonymous FTP is often used for "bounce attacks". Bounce attacks enable unauthorized users to scan networks, hosts and ports behind a firewall. This can result in internal networks, VPN and Intranets being compromised.

SOLUTION:

You should first decide if you really require the FTP service on this host. If you use it to exchange files between users, you should either use a dedicated password-protected account, or, by default, an unreadable but writeable directory.

The security of this last option depends on the secrecy of the filenames you upload and download from this directory. Therefore, avoid guessable filenames like "backup", "accounting" or "project".

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 metasploit

Reference: CVE-1999-0497

Description: Anonymous FTP Access Detection

Link:

https://raw.githubusercontent.com/rapid7/metasploit-framework/master/modules/auxiliary/scanner/ftp/ftp_anonymous.rb

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

No results available

 2 FTP users with Blank Password Allowed

port 21/tcp

QID: 27001
Category: File Transfer Protocol
Associated CVEs: [CVE-1999-0497](#)
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/07/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Users can access the FTP server with a blank password.

IMPACT:

Unauthorized users can view sensitive information, and, under specific circumstances, may be able to obtain remote shell access.

SOLUTION:

You should first decide if you really require the FTP service on this host. If you use it to exchange files between users, you should either use a dedicated password-protected account, or, by default, an unreadable but writable directory.

The security of this last option depends on the secrecy of the file names you upload and download from this directory. Therefore, avoid guessable file names like "backup", "accounting" or "project".

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 metasploit

Reference: CVE-1999-0497

Description: Anonymous FTP Access Detection

Link:

https://raw.githubusercontent.com/rapid7/metasploit-framework/master/modules/auxiliary/scanner/ftp/ftp_anonymous.rb

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

anonymous <NO_PASSWORD>
ftp <NO_PASSWORD>

2 HTTP Security Header Not Detected

port 80/tcp

QID: 11827
Category: CGI
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/02/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

This QID reports the absence of the following HTTP headers (https://www.owasp.org/index.php/OWASP_Secure-Headers_Project#tab=Headers) according to CWE-693: Protection Mechanism Failure (<https://cwe.mitre.org/data/definitions/693.html>):

X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.

Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

IMPACT:

Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:

Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: curl -IkL --verbose.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options

(<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/X-Content-Type-Options>) and Strict-Transport-Security (<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Strict-Transport-Security>) HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:

Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:

Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"

Nginx: add_header Strict-Transport-Security max-age=31536000;

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

X-Content-Type-Options HTTP Header missing on port 80.

  <div class="section_header">
    <div id="changes"></div>
    Configuration Overview
  </div>
  <div class="content_section_text">
    <p>
      Debian's Apache2 default configuration is different from the
      upstream default configuration, and split into several files optimized for
      interaction with Debian tools. The configuration system is
      <b>fully documented in
      /usr/share/doc/apache2/README.Debian.gz</b>. Refer to this for the full
      documentation. Documentation for the web server itself can be
      found by accessing the <a href="/manual">manual</a> if the <tt>apache2-doc</tt>
      package was installed on this server.
    </p>
    <p>
      The configuration layout for an Apache2 web server installation on Debian systems is as follows:
    </p>
    <pre>
/etc/apache2/
|-- apache2.conf
|  |-- ports.conf
|-- mods-enabled
|  |-- *.load
|  |-- *.conf
|-- conf-enabled
|  |-- *.conf
|-- sites-enabled
|  |-- *.conf
</pre>
    <ul>
      <li>
        <tt>apache2.conf</tt> is the main configuration
      </li>
    </ul>
  </div>

```

- file. It puts the pieces together by including all remaining configuration files when starting up the web server.
- `ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.
 - Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.
 - They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers
 - `a2enmod`,
`a2dismod`,
 - `a2ensite`,
`a2dissite`,
 - and
 - `a2enconf`,
`a2disconf`
 - See their respective man pages for detailed information.
 - The binary is called `apache2`. Due to the use of environment variables, in the default configuration, `apache2` needs to be started/stopped with `/etc/init.d/apache2` or `apache2ctl`. **Calling `/usr/bin/apache2` directly will not work** with the default configuration.

Document Roots

By default, Debian does not allow access through the web browser to `any` file apart of those located in `/var/www/`, [public_html](http://httpd.apache.org/docs/2.4/mod/mod_userdir.html) directories (when enabled) and `/usr/share/` (for web applications). If your site is using a web document root located elsewhere (such as in `/srv/`) you may need to whitelist your document root directory in `/etc/apache2/apache2.conf`.

The default Debian document root is `/var/www/html/`. You can make your own virtual hosts under `/var/www`. This is different to previous releases which provides better security out of the box.

Reporting Problems

Please use the `reportbug` tool to report bugs in the Apache2 package with Debian. However, check <http://bugs.debian.org/cgi-bin/pkgreport.cgi?ordering=normal;archive=0;src=apache2;repeatmerged=0>

```
rel="nofollow">existing bug reports</a> before reporting a new bug.
</p>
<p>
Please report bugs specific to modules (such as PHP and others)
to respective packages, not to the web server itself.
</p>
</div>

1 FTP Directory Listing

port 21/tcp

QID: 27367
Category: File Transfer Protocol
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 04/29/2013
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

FTP service is used to download or upload files from/to remote servers.

FTP service uses a username password authentication to allow or deny access.

It was common to allow anonymous access to FTP service for unauthenticated public file upload purposes. This configuration however is not considered safe in PCI related targets, since it is possible to obtain some information about the directory structure of the FTP server.

IMPACT:

N/A

SOLUTION:

If this vulnerability was reported on a PCI relevant machine then anonymous FTP service should be disabled.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

```
-rw-r--r-- 1 0 0 1864 May 04 2024 welcome-letter.txt
./
```

Potential Vulnerabilities (49)

5 OpenSSH Remote Code Execution (RCE) Vulnerability in its forwarded ssh-agent

QID: 38904

Category: General remote services
Associated CVEs: [CVE-2023-38408](#)
Vendor Reference: [OpenSSH 9.3p2](#)
Bugtraq ID: -
Service Modified: 04/23/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

We have discovered this vulnerability (CVE-2023-38408) - It is a condition where specific libraries loaded via ssh-agent(1)'s PKCS#11 support could be abused to achieve remote code execution via a forwarded agent socket if the conditions mentioned here (<https://www.openssh.com/txt/release-9.3p2>) are met.

Affected Versions:
OpenSSH versions prior to 9.3p2

IMPACT:

Successful exploitation allows an attacker to perform a remote code execution vulnerability via a forwarded agent socket.

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.3p2 (<https://www.openssh.com/txt/release-9.3p2>) or later to remediate these vulnerabilities.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

OpenSSH 9.3p2 (<https://www.openssh.com/txt/release-9.3p2>)

COMPLIANCE:

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_8.4p1 Debian-5+deb11u3 detected on port 22 over TCP.

4 OpenSSH Authentication Bypass Vulnerability

QID: 38919
Category: General remote services
Associated CVEs: [CVE-2023-51767](#)
Vendor Reference: [OpenSSH 9.6](#)
Bugtraq ID: -
Service Modified: 04/27/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

In OpenSSH, when common types of DRAM are used, might allow row hammer attacks (for authentication bypass) because the integer value of authenticated in mm_answer_authpassword does not resist flips of a single bit.

Affected Versions:

OpenSSH up to version through 10.0

IMPACT:

Successful exploitation allows OS command injection and row hammer attacks for authentication bypass.

SOLUTION:

There are no vendor supplied patches available at this time.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_8.4p1 Debian-5+deb11u3 detected on port 22 over TCP.

 4	Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.60 Multiple Security Vulnerabilities	port 80/tcp
QID:	731613	
Category:	CGI	
Associated CVEs:	CVE-2024-38472 , CVE-2024-38473 , CVE-2024-38474 , CVE-2024-38475 , CVE-2024-38476 , CVE-2024-38477 , CVE-2024-39573	
Vendor Reference:	Apache HTTP Server 2.4.60	
Bugtraq ID:	-	
Service Modified:	07/22/2026	
User Modified:	-	
Edited:	No	
PCI Vuln:	Yes	

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2024-38472: SSRF in Apache HTTP Server on Windows allows to potentially leak NTLM hashes to a malicious server via SSRF and malicious requests or content

CVE-2024-38473: Apache HTTP Server proxy encoding problem

CVE-2024-38474: Apache HTTP Server weakness with encoded question marks in backreferences

CVE-2024-38475: Apache HTTP Server weakness in mod_rewrite when first segment of substitution matches filesystem path.

CVE-2024-38476: Apache HTTP Server may use exploitable/malicious backend application output to run local handlers via internal redirect

CVE-2024-38477: Apache HTTP Server Crash resulting in Denial of Service in mod_proxy via a malicious request

CVE-2024-39573: Apache HTTP Server mod_rewrite proxy handler substitution

Affected Versions:

Apache HTTP Server versions prior to 2.4.60

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information, visit here (<https://httpd.apache.org/download.cgi>).

	4 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.64 Security Vulnerabilities (CVE-2024-47252)	port 80/tcp
---	---	-------------

QID: 732750

Category: CGI
Associated CVEs: [CVE-2024-47252](#)
Vendor Reference: [Apache_HTTP_Server_2.4.64](#)
Bugtraq ID: -
Service Modified: 04/23/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.
CVE-2024-47252: Apache HTTP Server: mod_ssl error log variable escaping
Affected Versions:
Apache httpd 2.4.x before 2.4.64

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

3 OpenSSH Double Free Vulnerability

QID:	38867
Category:	General remote services
Associated CVEs:	CVE-2021-28041
Vendor Reference:	OpenSSH Advisory
Bugtraq ID:	-
Service Modified:	09/23/2024

User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:
OpenSSH before 8.5

IMPACT:

Attacker can access the legacy operating system, or forward the agent to an attacker-controlled host.

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.5 (<https://www.openssh.com/txt/release-8.5>) or later to remediate these vulnerabilities.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
CVE-2021-28041 (<https://www.openssh.com/txt/release-8.5>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_8.4p1 Debian-5+deb11u3 detected on port 22 over TCP.

3 OpenSSH Man-in-the-Middle (MITM) Attack Vulnerability

QID: 38902
Category: General remote services
Associated CVEs: [CVE-2020-14145](#)
Vendor Reference: [CVE-2020-14145](#)
Bugtraq ID: -
Service Modified: 04/21/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

CVE-2020-14145: The client side in OpenSSH 5.7 through 8.4 has an Observable Discrepancy leading to an information leak in the algorithm negotiation. This allows man-in-the-middle attackers to target initial connection attempts (where no host key for the server has been cached by the client). NOTE: some reports state that 8.5 and 8.6 are also affected.

Affected Versions:

OpenSSH 5.7-8.6

IMPACT:

Successful exploitation allows man-in-the-middle attackers to target initial connection attempts

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.7 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

CVE-2020-14145 (<https://www.openssh.com/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable SSH-2.0-OpenSSH_8.4p1 Debian-5+deb11u3 detected on port 22 over TCP.

 3 OpenSSH SSH Protocol Vulnerability (CVE-2023-48795)

QID:	38984
Category:	General remote services
Associated CVEs:	CVE-2023-48795
Vendor Reference:	openssh 9.6
Bugtraq ID:	-
Service Modified:	04/06/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions:OpenSSH before version 9.6

IMPACT:

Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.

SOLUTION:

Customers are advised to upgrade to OpenSSH 9.6 (<https://www.openssh.com/txt/release-10.0>) or later to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

openssh 9.6 (<https://www.openssh.com/txt/release-9.6>)

Description:

VSFTPD 3.0.3 allows attackers to cause a denial of service due to limited number of connections allowed.
Link: <https://www.exploit-db.com/exploits/49719>

 nuclei-templates
Reference: CVE-2021-30047
Description: vsftpd < 3.0.3 - DoS
Link: <https://raw.githubusercontent.com/projectdiscovery/nuclei-templates/main/network/cves/2021/CVE-2021-30047.yaml>

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Potential Vulnerable version of VSFTPD 3.0.3 detected on port 21 over TCP.

 3 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.64 Security Vulnerabilities (CVE-2025-49812) port 80/tcp

QID: 732749
Category: CGI
Associated CVEs: [CVE-2025-49812](#)
Vendor Reference: [Apache_HTTP_Server_2.4.64](#)
Bugtraq ID: -
Service Modified: 04/23/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.
CVE-2025-49812: Apache HTTP Server: mod_ssl TLS upgrade attack
Affected Versions:
Apache httpd 2.4.x before 2.4.64

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)
Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

3 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.67 Security Vulnerabilities

port 80/tcp

QID:	734129
Category:	CGI
Associated CVEs:	CVE-2026-24072
Vendor Reference:	Apache_HTTP_Server_2.4.67
Bugtraq ID:	-
Service Modified:	05/22/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2026-24072: Apache HTTP Server: mod_rewrite elevation of privileges via ap_expr

Affected Versions:
Apache httpd 2.4.x before 2.4.67

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:20:33 GMT

2 OpenSSH Public-Key Authentication Vulnerability

QID: 38900
 Category: General remote services
 Associated CVEs: [CVE-2021-36368](#)
 Vendor Reference: [OpenSSH 8.9](#)
 Bugtraq ID: -
 Service Modified: 08/19/2025
 User Modified: -
 Edited: No
 PCI Vuln: No

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

CVE-2021-36368: If a client is using public-key authentication with agent forwarding but without -oLogLevel=verbose, and an attacker has silently modified the server to support the None authentication option, then the user cannot determine whether FIDO authentication is going to confirm that the user wishes to connect to that server, or that the user wishes to allow that server to connect to a different server on the user's behalf.

Affected Versions:
 OpenSSH versions prior to 8.9

IMPACT:

Successful exploitation allows a remote attacker silently modify the server to support the None authentication option when a client is using public-key authentication with agent forwarding but without -oLogLevel=verbose.

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.9 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:
 Following are links for downloading patches to fix the vulnerabilities:
 OpenSSH 8.9 or later (<https://www.openssh.com/>)

COMPLIANCE:

2 OpenSSH Probable User Enumeration Vulnerability

QID: 38903
Category: General remote services
Associated CVEs: [CVE-2016-20012](#)
Vendor Reference: [OpenSSH 8.8](#)
Bugtraq ID: -
Service Modified: 04/09/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

OpenSSH (OpenBSD Secure Shell) is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

OpenSSH contains the following vulnerabilities:

CVE-2016-20012: OpenSSH through 8.7 allows remote attackers, who have a suspicion that a certain combination of username and public key is known to an SSH server, to test whether this suspicion is correct. This occurs because a challenge is sent only when that combination could be valid for a login session.

Affected Versions:
OpenSSH versions prior to 8.8

IMPACT:

Successful exploitation allows a remote attacker to test and confirm if a certain combination of username and public key is known to an SSH server.

SOLUTION:

Customers are advised to upgrade to OpenSSH 8.8 (<https://www.openssh.com/>) or later to remediate these vulnerabilities.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
OpenSSH 8.8 or later (<https://www.openssh.com/>)

2 OpenSSH Expected Behavior Violation Vulnerability (CVE-2025-32728)

QID: 38979
Category: General remote services
Associated CVEs: [CVE-2025-32728](#)
Vendor Reference: [openssh 10.0](#)
Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

OpenSSH is a set of computer programs providing encrypted communication sessions over a computer network using the SSH protocol.

Affected Versions: OpenSSH before version 10.0

IMPACT:

Successful exploitation of this vulnerability could lead to a security breach or could affect integrity, availability, and confidentiality.

SOLUTION:

Customers are advised to upgrade to OpenSSH 10.0 (<https://www.openssh.com/txt/release-10.0>) or later to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

openssh 10.0 (<https://www.openssh.com/txt/release-10.0>)

CVE-2026-28780: Apache HTTP Server: buffer overflow in mod_proxy_ajp via ajp_msg_check_header()
Affected Versions:
Apache httpd 2.4.x before 2.4.67

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -

Date: Thu, 23 Jul 2026 07:20:33 GMT

Server: Apache/2.4.59 (Debian)

3 Remote Access or Management Service Detected

QID:	42017
Category:	General remote services
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	05/20/2024
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

A remote access or remote management service was detected. If such a service is accessible to malicious users it can be used to carry different type of attacks. Malicious users could try to brute force credentials or collect additional information on the service which could enable them in crafting further attacks.

The Results section includes information on the remote access service that was found on the target.

Services like Telnet, Rlogin, SSH, windows remote desktop, pcAnywhere, Citrix Management Console, Remote Admin (RAdmin), VNC, OPENVPN and ISAKMP are checked.

IMPACT:

Consequences vary by the type of attack.

SOLUTION:

Expose the remote access or remote management services only to the system administrators or intended users of the system.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Service name: SSH on TCP port 22.

Service name: FTP on TCP port 21.

3 FTP-Service Anonymous-Logon Information Gathering

QID:	45034
Category:	Information gathering
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	06/27/2018
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The scanner logged on anonymously to the target FTP service. The results section displays all the information that the scanner gathered from the target FTP service. This information would be useful for penetration testing and for launching more attacks/tests on the target FTP service or other services.

IMPACT:

 3 Content-Security-Policy HTTP Security Header Not Detected

port 80/tcp

QID:	48001
Category:	Information gathering
Associated CVEs:	-
Vendor Reference:	Content-Security-Policy
Bugtraq ID:	-
Service Modified:	03/11/2019
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The HTTP Content-Security-Policy response header allows web site administrators to control resources the user agent is allowed to load for a given page. This helps guard against cross-site scripting attacks (XSS).

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

There is no malware information for this vulnerability.

RESULTS:

Content-Security-Policy HTTP Header missing on port 80.

GET / HTTP/1.1

Host: proftpd-vuln.labvulnerabilities_vulnnet

Connection: Keep-Alive

2 STAT FTP Command Information Disclosure

port 21/tcp

QID: 27003
Category: File Transfer Protocol
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: 1506
Service Modified: 05/05/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

"STAT" is a command of the FTP protocol. It discloses an excessive amount of information about the state of the current server.

Note: This QID may be associated with CVE-2000-0646.

IMPACT:

Unauthorized users can exploit this command to obtain information about the FTP server, such as the number of users currently using it, the length of time it's been running, whether the unauthorized user is likely to be discovered by an Administrator, etc.

SOLUTION:

Patch -

Upgrade to the latest version of WFTPD (2.4.1RC12 or later), available from the WFTPD Web site (<http://www.wftpd.com/downloads.htm>).

Workaround: If your FTP server software allows you to, disable this command.

COMPLIANCE:

Not Applicable

 1 Host Scan Time - Scanner

QID:	45038
Category:	Information gathering
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	09/15/2022
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

 1 Scan Activity per Port

QID:	45426
Category:	Information gathering
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	06/24/2020
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This

information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Protocol	Port	Time

TCP	22	0:01:28
TCP	80	1:57:12

1 FTPS service detected

QID: 48173
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 10/28/2021
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

FTPS service configured on FTP server that requires FTPS is detected

IMPACT:

NA

SOLUTION:

If possible, use alternate services that provide encryption.
Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

FTPS service detected on port 21 over TCP.

 1 SSH Algorithms ChaCha20-Poly1305 or CBC-EtM Detected

QID: 48259
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 02/13/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The ChaCha20-Poly1305 algorithm and the CBC-EtM algorithm are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin).

IMPACT:

The algorithms are known to be vulnerable to the SSH Prefix Truncation Vulnerability (Terrapin). Successful exploitation of the vulnerability may allow an attacker to downgrade the security of an SSH connection when using SSH extension negotiation. The impact in practice heavily depends on the supported extensions. Most commonly, this will impact the security of client authentication when using an RSA public key.

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSH Algorithms ChaCha20-Poly1305 or CBC-EtM detected on port: 22
ChaCha20-Poly1305 Algorithm Support: True
CBC-EtM Algorithm Support: False

 1 Open TCP Services List

QID: 82023
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Port	IANA Assigned Ports/Services	Description	Service Detected	OS On Redirected Port

22	ssh	SSH Remote Login Protocol	ssh	
80	www-http	World Wide Web HTTP	http	

1 ICMP Replies Received

QID: 82040
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/16/2003
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

ICMP Reply Type	Triggered By	Additional Information
Unreachable (type=3 code=3)	UDP Port 20001	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 31338	Port Unreachable
Echo (type=0 code=0)	Echo Request	Echo Reply
Unreachable (type=3 code=3)	UDP Port 1812	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 1	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 11867	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 1981	Port Unreachable

1 Degree of Randomness of TCP Initial Sequence Numbers

QID: 82045
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/19/2004
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

TCP Initial Sequence Numbers (ISNs) obtained in the SYNACK replies from the host are analyzed to determine how random they are. The average change between subsequent ISNs and the standard deviation from the average are displayed in the RESULT section. Also included is the degree of difficulty for exploitation of the TCP ISN generation scheme used by the host.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSH is a secure protocol, provided it is fully patched, properly configured, and uses FIPS approved algorithms.

Supported ciphers suites reported in this qid are in server-preferred order.

For Red Hat ES 4:-

SSH1 supported	yes
Supported authentication methods for SSH1	RSA,password
Supported ciphers for SSH1	3des,blowfish
SSH2 supported	yes
Supported keys exchange algorithm for SSH2	diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, diffie-hellman-group1-sha1
Supported decryption ciphers for SSH2	aes128-cbc, 3des-cbc, blowfish-cbc, cast128-cbc, arcfour, aes192-cbc, aes256-cbc, rijndael-cbc@lysator.liu.se, aes128-ctr, aes192-ctr, aes256-ctr
Supported encryption ciphers for SSH2	aes128-cbc, 3des-cbc, blowfish-cbc, cast128-cbc, arcfour, aes192-cbc, aes256-cbc, rijndael-cbc@lysator.liu.se, aes128-ctr, aes192-ctr, aes256-ctr
Supported decryption mac for SSH2	hmac-md5, hmac-sha1, hmac-ripemd160, hmac-ripemd160@openssh.com, hmac-sha1-96, hmac-md5-96
Supported encryption mac for SSH2	hmac-md5, hmac-sha1, hmac-ripemd160, hmac-ripemd160@openssh.com, hmac-sha1-96, hmac-md5-96
Supported authentication methods for SSH2	publickey, gssapi-with-mic, password

IMPACT:

Successful exploitation allows an attacker to execute arbitrary commands on the SSH server or otherwise subvert an encrypted SSH channel with arbitrary data.

SOLUTION:

SSH version 2 is preferred over SSH version 1.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SSH1 supported	no
SSH2 supported	yes
Supported key exchange algorithms for SSH2	curve25519-sha256, curve25519-sha256@libssh.org, ecdh-sha2-nistp256, ecdh-sha2-nistp384, ecdh-sha2-nistp521, diffie-hellman-group-exchange-sha256, diffie-hellman-group16-sha512, diffie-hellman-group18-sha512, diffie-hellman-group14-sha256, kex-strict-s-v00@openssh.com
Supported host key algorithms for SSH2	rsa-sha2-512, rsa-sha2-256, ssh-rsa, ecdsa-sha2-nistp256, ssh-ed25519
Supported decryption ciphers for SSH2	chacha20-poly1305@openssh.com, aes128-ctr, aes192-ctr, aes256-ctr, aes128-gcm@openssh.com, aes256-gcm@openssh.com
Supported encryption ciphers for SSH2	chacha20-poly1305@openssh.com, aes128-ctr, aes192-ctr, aes256-ctr, aes128-gcm@openssh.com, aes256-gcm@openssh.com
Supported decryption macs for SSH2	umac-64-etm@openssh.com, umac-128-etm@openssh.com, hmac-sha2-256-etm@openssh.com, hmac-sha2-512-etm@openssh.com, hmac-sha1-etm@openssh.com, umac-64@openssh.com, umac-128@openssh.com, hmac-sha2-256, hmac-sha2-512, hmac-sha1
Supported encryption macs for SSH2	umac-64-etm@openssh.com, umac-128-etm@openssh.com, hmac-sha2-256-etm@openssh.com, hmac-sha2-512-etm@openssh.com, hmac-sha1-etm@openssh.com, umac-64@openssh.com, umac-128@openssh.com, hmac-sha2-256, hmac-sha2-512, hmac-sha1
Supported decompression for SSH2	none, zlib@openssh.com
Supported compression for SSH2	none, zlib@openssh.com
Supported authentication methods for SSH2	publickey, password

  Configuration Overview
</div>
<div class="content_section_text">
  <p>
    Debian's Apache2 default configuration is different from the
    upstream default configuration, and split into several files optimized for
    interaction with Debian tools. The configuration system is
    <b>fully documented in
    /usr/share/doc/apache2/README.Debian.gz</b>. Refer to this for the full
    documentation. Documentation for the web server itself can be
    found by accessing the <a href="/manual">manual</a> if the <tt>apache2-doc</tt>
    package was installed on this server.
  </p>
  <p>
    The configuration layout for an Apache2 web server installation on Debian systems is as follows:
  </p>
  <pre>
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
</pre>
  <ul>
    <li>
      <tt>apache2.conf</tt> is the main configuration
      file. It puts the pieces together by including all remaining configuration
      files when starting up the web server.
    </li>
    <li>
      <tt>ports.conf</tt> is always included from the
      main configuration file. It is used to determine the listening ports for
      incoming connections, and this file can be customized anytime.
    </li>
  </ul>

```

```

</li>
    Configuration files in the <tt>mods-enabled/</tt>,
    <tt>conf-enabled/</tt> and <tt>sites-enabled/</tt> directories contain
    particular configuration snippets which manage modules, global configuration
    fragments, or virtual host configurations, respectively.
</li>

<li>
    They are activated by symlinking available
    configuration files from their respective
    *-available/ counterparts. These should be managed
    by using our helpers
    <tt>
        a2enmod,
        a2dismod,
    </tt>
    <tt>
        a2ensite,
        a2dissite,
    </tt>
    and
    <tt>
        a2enconf,
        a2disconf
    </tt>. See their respective man pages for detailed information.
</li>

<li>
    The binary is called apache2. Due to the use of
    environment variables, in the default configuration, apache2 needs to be
    started/stopped with <tt>/etc/init.d/apache2</tt> or <tt>apache2ctl</tt>.
    <b>Calling <tt>/usr/bin/apache2</tt> directly will not work</b> with the
    default configuration.
</li>

 1 Apache Default Installation/Welcome Page Detected

port 80/tcp

QID: 48065
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/21/2019
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Apache default installation or "Welcome" page is installed on this server. This usually indicates a newly installed server which has not yet been configured properly and which may not be known about.

IMPACT:

Apache is installed by default and the user may not be aware that the web server is running. These servers are rarely patched and rarely monitored, providing hackers with a convenient target that is not likely to trip any alarms.

SOLUTION:

Customers are recommended to disable default Apache welcome configuration.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

<div id="changes"></div>

Configuration Overview

</div>

<div class="content_section_text">

<p>

Debian's Apache2 default configuration is different from the upstream default configuration, and split into several files optimized for interaction with Debian tools. The configuration system is **fully documented** in `/usr/share/doc/apache2/README.Debian.gz`. Refer to this for the full documentation. Documentation for the web server itself can be found by accessing the [manual](/manual) if the `apache2-doc` package was installed on this server.

</p>

<p>

The configuration layout for an Apache2 web server installation on Debian systems is as follows:

</p>

<pre>

```
/etc/apache2/
|-- apache2.conf
|   |-- ports.conf
|-- mods-enabled
|   |-- *.load
|   |-- *.conf
|-- conf-enabled
|   |-- *.conf
|-- sites-enabled
|   |-- *.conf
</pre>
```

</pre>

`apache2.conf` is the main configuration file. It puts the pieces together by including all remaining configuration files when starting up the web server.

`ports.conf` is always included from the main configuration file. It is used to determine the listening ports for incoming connections, and this file can be customized anytime.

Configuration files in the `mods-enabled/`, `conf-enabled/` and `sites-enabled/` directories contain particular configuration snippets which manage modules, global configuration fragments, or virtual host configurations, respectively.

They are activated by symlinking available configuration files from their respective `*-available/` counterparts. These should be managed by using our helpers

<tt>

a2enmod,
a2dismod,

</tt>

<tt>

a2ensite,
a2dissite,

</tt>

and

<tt>

a2enconf,
a2disconf

</tt>. See their respective man pages for detailed information.

```

        </li>
        The binary is called apache2. Due to the use of
        environment variables, in the default configuration, apache2 needs to be
        started/stopped with <tt>/etc/init.d/apache2</tt> or <tt>apache2ctl</tt>.
        <b>Calling <tt>/usr/bin/apache2</tt> directly will not work</b> with the
        default configuration.
    </li>
</ul>
</div>

<div class="section_header">
    <div id="docroot"></div>
    Document Roots
</div>

<div class="content_section_text">
    <p>
        By default, Debian does not allow access through the web browser to
        <em>any</em> file apart of those located in <tt>/var/www</tt>,
        <a href="http://httpd.apache.org/docs/2.4/mod/mod_userdir.html" rel="nofollow">public_html</a>
        directories (when enabled) and <tt>/usr/share</tt> (for web
        applications). If your site is using a web document root
        located elsewhere (such as in <tt>/srv</tt>) you may need to whitelist your
        document root directory in <tt>/etc/apache2/apache2.conf</tt>.
    </p>
    <p>
        The default Debian document root is <tt>/var/www/html</tt>. You
        can make your own virtual hosts under /var/www. This is different
        to previous releases which provides better security out of the box.

1 Referrer-Policy HTTP Security Header Not Detected

port 80/tcp

QID: 48131
Category: Information gathering
Associated CVEs: -
Vendor Reference: [Referrer-Policy](#)
Bugtraq ID: -
Service Modified: 01/18/2023
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

- 1) no-referrer
- 2) no-referrer-when-downgrade
- 3) same-origin
- 4) origin

- 5) origin-when-cross-origin
- 6) strict-origin
- 7) strict-origin-when-cross-origin

IMPACT:

The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:

Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

- <https://www.w3.org/TR/referrer-policy/> (<https://www.w3.org/TR/referrer-policy/>)

1 Web Server Supports HTTP Request Pipelining

port 80/tcp

QID: 86565
Category: Web server
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 02/22/2005
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:

Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker (<http://www.defcon.org/images/defcon-11/dc-11-presentations/dc-11-Roelker/dc-11-roelker-paper.pdf>), it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Splitting style attacks.

SOLUTION:

Windows 7

Vulnerabilities (5)

4 Remote User List Disclosure Using NetBIOS

QID: 45003
Category: Information gathering
Associated CVEs: [CVE-2000-1200](#)
Vendor Reference: -
Bugtraq ID: 959
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

A null session connection to the IPC\$ share was successful. NetBIOS access can be obtained with any authenticated account on this host. Therefore unauthorized users can steal the remote user list. This kind of attack is commonly exploited by users with weak passwords, such as the GUEST account.

Please note that this QID is posted when Qualys is able to enumerate the user-list of a target via the Net* API functions (in which case QID 70003 is posted as well), or when Qualys is able to "brute-force" known SIDs via LsarLookupSids (in which case only QID 45003 is posted). While both techniques use anonymous NetBIOS sessions, we are unaware of a system-level fix for LsarLookupSids, as Microsoft considers this to be requisite functionality.

IMPACT:

By exploiting this vulnerability, unauthorized users can launch brute force password attacks and other intrusive attacks based on collected information. Employee, customer, and partner information may be gathered. Spamming the user list is also possible.

SOLUTION:

It is recommended that you disable null sessions.
Before editing any configuration file in a production environment, the changes should be well tested in a rehearsal environment.
Read the Microsoft documents called How to Use the RestrictAnonymous Registry Value and Restricting Anonymous Access for more information. If this vulnerability was discovered on a domain controller, please note that some of the recommended settings may not have any effect. Read the Microsoft article Description of Dcpromo Permissions Choices for more information regarding Pre-Windows 2000 Compatible Access.

For Windows NT, setting this registry value limits only certain interfaces to this data. It is not possible to completely eliminate this vulnerability through a registry setting.

There is another interesting Microsoft document called Local Policies ([http://technet.microsoft.com/en-us/library/cc772979\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc772979(v=ws.10).aspx)) about Windows security policies settings for local policies.

Windows XP onwards Microsoft has added more granular control to the anonymous user access by adding couple of more DWORD registry values in the same key location as RestrictAnonymous, RestrictAnonymousSAM and EveryoneIncludesAnonymous. Set RestrictAnonymous = 1 to restrict share information access, RestrictAnonymousSAM = 1 to prevent enumeration of SAM accounts (User Accounts) and EveryoneIncludesAnonymous = 0 to prevent null-sessions from having any rights. Setting the RestrictAnonymous value to 1 restricts null session access to unauthenticated users to all server pipes and shares except those listed in the NullSessionPipes and NullSessionShares entries. Additionally set HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\lanmanserver\parameters, NullSessionPipes and NullSessionShares, to a null string.

For Samba servers there is no direct way of disabling null session access. A workaround is to specify a non existing UNIX account in global section of Samba config file. guest account = NON EXISTING USER.

Adding 'restrict anonymous = 2' in smb.conf can help resolve the issue.

Note: Please be aware that changing the restrictanonymous setting to the highest security level for example restrictanonymous = 2 in windows 2000 may disable older programs that make use of this account. It will also affect Windows NT 4.0 Domain Controllers from communicating with each other between trust relationships.

If possible, filter out Microsoft networking ports such as TCP ports 135, 137, 138, 139, and UDP ports 135, 137, 138.

4 Null Session/Password NetBIOS Access

| | |
|-------------------|-------------------------------|
| QID: | 70003 |
| Category: | SMB / NETBIOS |
| Associated CVEs: | CVE-1999-0519 |
| Vendor Reference: | - |
| Bugtraq ID: | - |
| Service Modified: | 04/07/2022 |
| User Modified: | - |
| Edited: | No |
| PCI Vuln: | Yes |

THREAT:

Unauthorized users can connect to this NetBIOS service without a password.

IMPACT:

Unauthorized users may be able to exploit this vulnerability to obtain sensitive information about your system resources, such as a list of all accounts or shared resources on this host. For Windows hosts, unauthorized users may also be able to access the registry, and depending on the Windows version and registry permission settings, make modifications to the registry.

SOLUTION:

Null NetBIOS sessions can be disabled using the following methods:

Windows NT: 1. Set the following registry key:
HKLM\System\CurrentControlSet\Control\Lsa
Name: RestrictAnonymous
Type: REG_DWORD Value: 1
2. Restart your computer.

Windows 2000:
1. Start "Control Panel-->Administrative Tools-->Local Security Policy".
2. Open "Local Policies-->Security Options".
3. Make sure "Additional restrictions of anonymous connections" is set to "No access without explicit anonymous permissions".
4. Restart your computer.

Windows XP/2003: 1. Start "Control Panel-->Administrative Tools-->Local Security Policy".
2. Open "Local Policies-->Security Options".
3. Make sure the following two policies are enabled:
* Network Access: Do not allow anonymous enumeration of SAM accounts
* Network Access: Do not allow anonymous enumeration of SAM accounts and shares
4. Disable Network Access: Let Everyone permissions apply to anonymous users.
5. Restart your computer. The above settings have no impact on domain controllers. If this vulnerability was discovered on a domain controller, recommended settings may not have any effect. Samba:
Make the following settings in smb.conf:
* set "security" to "user" or "domain" or "server" as per your requirements.
* set "map_to_guest" to "Never"

SECURITY = USER

This is the default security setting in Samba 2.2. With user-level security a client must first "log-on" with a valid username and password (which can be mapped using the username map parameter). Encrypted passwords can also be used in this security mode. Parameters such as user and guest only if set are then applied and may change the UNIX user to use on this connection, but only after the user has been successfully authenticated.

SECURITY = SERVER

In this mode Samba will try to validate the username/password by passing it to another SMB server, such as an NT box. If this fails it will revert to security = user, but note that if encrypted passwords have been negotiated then Samba cannot revert back to checking the UNIX password file, it must have a valid smbpasswd file to check users against. See the documentation file in the docs/ directory ENCRYPTION.txt for details on how to set this up.

SECURITY = DOMAIN

This mode will only work correctly if smbpasswd has been used to add this machine into a Windows NT Domain. It expects the encrypted passwords parameter to be set to true. In this mode Samba will try to validate the username/password by passing it to a Windows NT Primary or Backup Domain Controller, in exactly the same way that a Windows NT Server would do.

Also add "restrict anonymous = 2" to the "[global]" configuration section.

Note: Setting this parameter in Samba versions prior to 4 may impact Samba's ability to service Windows 9x clients, act as a Domain Controller or serve as the Master Browser.

Windows Server 2008, 2012, 2016 Disable Server 2008 Null Sessions
(<http://social.technet.microsoft.com/Forums/en-US/winservergen/thread/841523db-8c4b-43a0-9f28-be7270f92e2b>), Disable Server Null Sessions
(<https://social.technet.microsoft.com/Forums/ie/en-US/522a652b-750c-4ccf-b182-362e45cbe9a7/domain-controller-smb-null-session-enumeration?forum=winserverDS>), Pre-Windows 2000 Compatible Access

3 NetBIOS Shared Folder List Available

QID: 70001
Category: SMB / NETBIOS
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 10/14/2011
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Unauthorized remote users can list all file systems on this host that are accessible from a remote system.

IMPACT:

If successfully exploited, unauthorized users can use this information to brute force attack the shared resources and initiate file transfers with this server.

SOLUTION:

Use the Microsoft Computer Management MMC snap-in to connect and review the shares. By default C\$, Admin\$, and IPC\$ are shared on all Windows machines.

Review the machine to ensure that users have not added any additional unauthorized shares, and that all exposed shares are valid .

If no shares are needed, you can filter all Microsoft networking and Samba server ports (TCP ports 135, 137, 138, 139, 445 and UDP ports 135, 137, 138) at your firewall and disable null sessions to NetBIOS.

A suggested workaround.

Before editing any configuration file in a production environment, the changes should be well tested in a rehearsal environment. Adding 'restrict anonymous = 2' in smb.conf can help resolve the issue.

A workaround method for non-domain machines is to modify the local policy.

1. Navigate to Administrative tools.
2. Open "Local Security Policy Settings"
3. Click the plus sign of the folder named "Local Policies"
4. Select "Security Options" within the "Local Policies" folder
6. Browse to the policy "Network access: Do not allow anonymous enumeration of SAM accounts and shares"
7. Enabled the policy. For Servers this is disabled by default.
8. Reboot the computer for the changes to take effect.

3 SMB Signing Disabled or SMB Signing Not Required

QID: 90043
Category: Windows
Associated CVEs: -
Vendor Reference: -

Bugtraq ID: -
Service Modified: 10/25/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

This host does not seem to be using SMB (Server Message Block) signing. SMB signing is a security mechanism in the SMB protocol and is also known as security signatures. SMB signing is designed to help improve the security of the SMB protocol.

SMB signing adds security to a network using NetBIOS, avoiding man-in-the-middle attacks.

When SMB signing is enabled on both the client and server SMB sessions are authenticated between the machines on a packet by packet basis.

IMPACT:

Unauthorized users sniffing the network could catch many challenge/response exchanges and replay the whole thing to grab particular session keys,

and then authenticate on the Domain Controller.

SOLUTION:

Without SMB signing, a device could intercept SMB network packets from an originating computer, alter their contents, and broadcast them to the destination computer. Since, digitally signing the packets enables the recipient of the packets to confirm their point of origination and their authenticity, it is recommended that SMB signing is enabled and required.

Please refer to Microsoft's article 887429 (<http://support.microsoft.com/kb/887429>) and The Basics of SMB Signing (covering both SMB1 and SMB2) (<https://docs.microsoft.com/en-us/archive/blogs/josebda/the-basics-of-smb-signing-covering-both-smb1-and-smb2>) for information on enabling SMB signing.

For Windows Server 2008 R2, Windows Server 2012, please refer to Microsoft's article Require SMB Security Signatures (<http://technet.microsoft.com/en-us/library/cc731957.aspx>) for information on enabling SMB signing. For group policies please refer to Microsoft's article Modify Security Policies in Default Domain Controllers Policy (<http://technet.microsoft.com/en-us/library/cc731654>)

For UNIX systems

To require samba clients running "smbclient" to use packet signing, add the following to the "[global]" section of the Samba configuration file:

client signing = mandatory

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

3 SMBv2 Signing Not Required

QID: 92094
Category: Windows
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/26/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Server Message Block (SMB) protocol provides the basis for file and print sharing and many other networking operations, such as remote Windows administration. To prevent man-in-the-middle attacks that modify SMB packets in transit, the SMB protocol supports the digital signing of SMB packets.

Beginning with SMBv2 clients and servers, signing can be either required or not required.

IMPACT:

Unauthorized users sniffing the network could catch many challenge/response exchanges and replay the whole thing to grab particular session keys, and then authenticate on the Domain Controller.

SOLUTION:

Customers are advised to refer to Microsoft network server: Digitally sign communications (always) (<https://learn.microsoft.com/en-us/windows/security/threat-protection/security-policy-settings/microsoft-network-server-digitally-sign-communications-always#default-values>) or Microsoft network client: Digitally sign communications (always) (<https://learn.microsoft.com/en-us/windows/security/threat-protection/security-policy-settings/microsoft-network-client-digitally-sign-communications-always>) for more information pertaining to SMBv2 best practices, location, values, policy management and security considerations.

For Linux systems running Samba, customers are advised to review the smb.conf configuration file and refer to the "server signing" setting.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

SMB2 Signing not required

4 Samba Writable Share Remote Code Execution Vulnerability

| | |
|-------------------|----------------------------------|
| QID: | 38671 |
| Category: | General remote services |
| Associated CVEs: | CVE-2017-7494 |
| Vendor Reference: | Samba [Announce] |
| Bugtraq ID: | 98636 |
| Service Modified: | 05/19/2026 |
| User Modified: | - |
| Edited: | No |
| PCI Vuln: | Yes |

THREAT:

Samba is a freely available file and printer sharing application. Samba allows users to share files and printers between operating systems on UNIX and Windows platforms.

The vulnerability allows a malicious client to upload a shared library to a writable share, and then cause the server to load and execute it.

Affected Versions:

Samba versions 3.5.0 onwards 4.6.3, 4.5.9 and 4.4.13 are vulnerable

IMPACT:

Successful exploitation allows a remote attacker to execute arbitrary code on a targeted system.

SOLUTION:

Customers are advised to install Samba 4.6.4, 4.5.10, 4.4.14 (<https://www.samba.org/samba/>) or later versions to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba 4.6.4, 4.5.10, 4.4.14 or later (<https://www.samba.org/samba/>)

4 Samba Server Multiple Vulnerabilities

QID: 38707

Category: General remote services

Associated CVEs: [CVE-2018-1050](#), [CVE-2018-1057](#)

Vendor Reference: [Samba \[Announce\]](#)

Bugtraq ID: 103387,103382

Service Modified: 09/30/2025

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

Samba is a freely available file and printer sharing application.

Missing input sanitization checks on some of the input parameters to spools RPC calls could cause the print spooler service to crash. If the RPC spoolss service is left by default as an internal service, all a client can do is crash its own authenticated connection.(CVE-2018-1050)

Password reset flaw exists on all versions of Samba from 4.0.0 on-wards, but works only in Samba Active Directory DC implementation, as it doesn't properly validate permissions of users when they request to modify passwords over LDAP.(CVE-2018-1057)

Affected Versions:

All versions of Samba from 4.0.0 onward.

IMPACT:

On successful exploitation Missing null pointer checks may crash the external print server process and AD DC any authenticated user can change other users' passwords over LDAP, including the passwords of administrative users and service accounts.

SOLUTION:

Customers are advised to install Samba 4.7.6, 4.6.14 and 4.5.16 (<https://www.samba.org/samba/>) or later versions to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba 4.7.6, 4.6.14 and 4.5.16 or later (<https://www.samba.org/samba/history/security.html>)

Samba 4.5.9

4 Samba Out-Of-Bounds Heap Read/Write Vulnerability

QID: 38857

Category: General remote services

Associated CVEs: [CVE-2021-44142](#)

Vendor Reference: [Samba Security Advisory](#)

Bugtraq ID: -

Service Modified: 03/12/2026

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

All versions of Samba prior to 4.13.17 are vulnerable to an out-of-bounds heap read write vulnerability that allows remote attackers to execute arbitrary code as root on affected Samba installations that use the VFS module vfs_fruit.

The problem in vfs_fruit exists in the default configuration of the fruit VFS module using fruit:metadata=netatalk or fruit:resource=file. If both options are set to different settings than the default values, the system is not affected by the security issue.

Affected Versions:

All versions of Samba prior to 4.13.17 are vulnerable

IMPACT:

Successful exploitation of the vulnerability may allow a remote attacker to execute arbitrary code as root user on affected Samba installations.

SOLUTION:

Customers are advised to update to Samba Version 4.13.17, 4.14.12, 4.15.5 or later to patch the vulnerability. For more information please refer to the following Samba Security Advisory (<https://www.samba.org/samba/security/CVE-2021-44142.html>) Workaround: As a workaround remove the "fruit" VFS module from the list of configured VFS objects in any "vfs objects" line in the Samba configuration smb.conf. Note that changing the VFS module settings fruit:metadata or fruit:resource to use the unaffected setting causes all stored information to be inaccessible and will make it appear to macOS clients as if the information is lost.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
NA (<https://www.samba.org/samba/security/CVE-2021-44142.html>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 nvd

Reference: CVE-2021-44142
Description: The Samba vfs_fruit module uses extended file attributes (EA, xattr) to provide "...enhanced compatibility with Apple SMB clients and interoperability with a Netatalk 3 AFP fileserver." Samba versions prior to 4.13.17, 4.14.12 and 4.15.5 with vfs_fruit configured allow out-of-bounds heap read and write via specially crafted extended file attributes. A remote attacker with write access to extended file attributes can execute arbitrary code with the privileges of smbd, typically root.

THREAT:

All affected versions of Samba are vulnerable to privilege escalation vulnerability

Affected Versions:
Samba versions prior to 4.22.10
Samba versions from 4.23.0 prior to 4.23.8
Samba versions from 4.24.0 prior to 4.24.3

IMPACT:

Successful exploitation may lead to remote code execution.

SOLUTION:

For more information please refer to the samba security advisory for following CVE-2022-38023 (<https://www.samba.org/samba/security/CVE-2026-4408.html>)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

CVE-2026-4408 (<https://www.samba.org/samba/security/CVE-2026-4408.html>)

COMPLIANCE:

Not Applicable

Samba 4.5.9

3 Samba Heimdal Kerberos Man-in-the-Middle Vulnerability

QID: 70079
Category: SMB / NETBIOS
Associated CVEs: [CVE-2017-11103](#)
Vendor Reference: [Samba Security](#)
Bugtraq ID: 99551
Service Modified: 07/13/2017
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Samba is a freely available file and printer sharing application. Samba allows users to share files and printers between operating systems on UNIX and Windows platforms.

All versions of Samba from 4.0.0 include an embedded copy of Heimdal Kerberos. Heimdal has made a security release. The impact for Samba is particularly strong for cases where the Samba DRS replication service contacts another DC requesting replication of user passwords, as these could then be controlled by the attacker.

IMPACT:

Successful exploitation allows an unauthenticated attacker to gain elevated access.

SOLUTION:

Customers are advised to install Samba 4.6.6, 4.5.12 and 4.4.15 (<https://www.samba.org/samba/>) or later versions to remediate this vulnerability.

Workaround:

Samba versions built against MIT Kerberos are not impacted. Unless you are running Samba as an AD DC, then rebuild samba using: `./configure --with-system-mitkrb5`.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Samba 4.6.6, 4.5.12 and 4.4.15 (<https://www.samba.org/samba/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

| Bugtraq ID: | - |
| Service Modified: | 07/08/2026 |
| User Modified: | - |
| Edited: | No |
| PCI Vuln: | No |

THREAT:

Several different techniques can be used to identify the operating system (OS) running on a host. A short description of these techniques is provided below. The specific technique used to identify the OS on this host is included in the RESULTS section of your report.

1) TCP/IP Fingerprint: The operating system of a host can be identified from a remote system using TCP/IP fingerprinting. All underlying operating system TCP/IP stacks have subtle differences that can be seen in their responses to specially-crafted TCP packets. According to the results of this "fingerprinting" technique, the OS version is among those listed below.

Note that if one or more of these subtle differences are modified by a firewall or a packet filtering device between the scanner and the host, the fingerprinting technique may fail. Consequently, the version of the OS may not be detected correctly. If the host is behind a proxy-type firewall, the version of the operating system detected may be that of the firewall instead of the host being scanned.

2) NetBIOS: Short for Network Basic Input Output System, an application programming interface (API) that augments the DOS BIOS by adding special functions for local-area networks (LANs). Almost all LANs for PCs are based on the NetBIOS. Some LAN manufacturers have even extended it, adding additional network capabilities. NetBIOS relies on a message format called Server Message Block (SMB).

3) PHP Info: PHP is a hypertext pre-processor, an open-source, server-side, HTML-embedded scripting language used to create dynamic Web pages. Under some configurations it is possible to call PHP functions like phpinfo() and obtain operating system information.

4) SNMP: The Simple Network Monitoring Protocol is used to monitor hosts, routers, and the networks to which they attach. The SNMP service maintains Management Information Base (MIB), a set of variables (database) that can be fetched by Managers. These include "MIB_II.system.sysDescr" for the operating system.

IMPACT:

Not applicable.

SOLUTION:

Not applicable.

| Windows 2008 R2/7 | NTLMSSP | |

2 Open DCE-RPC / MS-RPC Services List

QID: 70022
Category: SMB / NETBIOS
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/22/2019
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The following DCE-RPC / MS-RPC services are active on the remote host.

IMPACT:

N/A

SOLUTION:

Shut down any unknown or unused service on the list. In Windows, this is done in the "Services" Control Panel. In other environments, this usually requires editing a configuration file or start-up script.

If you have provided Windows Authentication credentials, the Microsoft

Registry service supporting the named pipe "\PIPE\winreg" must be present to allow CIFS to access the Registry.

COMPLIANCE:

2 Microsoft Windows Users With Privilege - Backup Files and Directories

QID: 105101
Category: Security Policy
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 03/21/2005
User Modified: -
Edited: No

PCI Vuln: No

THREAT:

The SeBackupPrivilege setting allows the user to circumvent file and directory permissions to back up the system. The privilege is selected only when an application attempts access by using the NTFS backup application programming interface API. Otherwise, normal file and directory permissions apply. By default administrators and backup operators have access.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Type: CobIT

Section: DS5.4

Description: User Account Management

Ensure that requesting, establishing, issuing, suspending, modifying and closing user accounts and related user privileges are addressed by user account management. An approval procedure outlining the data or system owner granting the access privileges should be included. These procedures should apply for all users, including administrators (privileged users), internal and external users, for normal and emergency cases. Rights and obligations relative to access to enterprise systems and information are contractually arranged for all types of users. Perform regular management review of all accounts and related privileges.

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

1 Host Scan Time - Scanner

QID: 45038
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/15/2022
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

SMBv2 is enabled.

1 Scan Activity per Port

QID: 45426
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/24/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

1 Windows Authentication Method

QID: 70028
Category: SMB / NETBIOS
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -

Service Modified: 12/09/2008
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Windows authentication was performed. The Results section in your detailed results includes a list of authentication credentials used.

The service also attempts to authenticate using common credentials. You should verify that the credentials used for successful authentication were those that were provided in the Windows authentication record. User-provided credentials failed if the discovery method shows "Unable to log in using credentials provided by user, fallback to NULL session". If this is the case, verify that the credentials specified in the Windows authentication record are valid for this host.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

1 SMB Shares Readable Without Authentication

QID: 70062
Category: SMB / NETBIOS
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/25/2013
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Unauthorized remote users can connect to SMB shares on the target and read directory contents or files.

IMPACT:

Content of directories or files stored on the target is accessible to remote users without prior authentication, either via anonymous login or by guest login without a password.

SOLUTION:

Remove any shares which are not required, or configure the shares to disallow anonymous access or access from a guest user without a password.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

1 Open TCP Services List

QID: 82023
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

| Port | IANA Assigned Ports/Services | Description | Service Detected | OS On Redirected Port |
|------|------------------------------|-------------|------------------|-----------------------|

| | | | |
|-----|--------------|-------------------------|--------------|
| 139 | netbios-ssn | NETBIOS Session Service | netbios ssn |
| 445 | microsoft-ds | Microsoft-DS | microsoft-ds |

1 ICMP Replies Received

QID: 82040
 Category: TCP/IP
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 01/16/2003
 User Modified: -
 Edited: No
 PCI Vuln: No

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
 Timestamp Request (to trigger Timestamp Reply)
 Address Mask Request (to trigger Address Mask Reply)
 UDP Packet (to trigger Port Unreachable Reply)
 IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

| ICMP Reply Type | Triggered By | Additional Information |
|-----------------------------|-----------------------|------------------------|
| Echo (type=0 code=0) | Echo Request | Echo Reply |
| Unreachable (type=3 code=3) | UDP Port 1 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 11867 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 20001 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 31338 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 1981 | Port Unreachable |
| Time Stamp (type=14 code=0) | Time Stamp Request | 03:01:56 GMT |
| Unreachable (type=3 code=3) | UDP Port 1011 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 1024 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 15253 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 2536 | Port Unreachable |
| Unreachable (type=3 code=3) | UDP Port 1812 | Port Unreachable |
| Unreachable (type=3 code=2) | IP with High Protocol | Protocol Unreachable |

SOLUTION:

N/A

COMPLIANCE:

Service Modified: 06/07/2021
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Refer to the RESULTS section for a list of Windows shares that are readable by Everyone and optional counting of the number of files in each share.

Columns in RESULTS section:

The Share column shows the share name.

The Path column shows the path to the share.

The Files column shows the number of files found in each share.

The Writable column indicates whether all the files in each share are writable by Everyone (Yes/No).

The Comments section refers to optional counting of files in the share if the Dissolvable Agent is enabled.

In the Comments column "OK" indicates that the scanning engine finished counting the files in the share. "Limited" indicates that the scanning engine either a) reached its time limit before finishing the file count, or b) reached its maximum number of files to count, or c) failed to count files at all. If Comments is "Limited", this could also imply the number of files in Files may be less than the actual value. "Count skipped" indicates that counting of files wasn't attempted because the Dissolvable Agent is not enabled.

IMPACT:

N/A

SOLUTION:

|-------|---------|-------|----------|---------------|
| data | C:\data | 0 | Yes | Count skipped |

172.30.6.3 (apache-path-traversal.labvulnerabilities_vulnnet, -)

Vulnerabilities (1)

 2 HTTP Security Header Not Detected

port 80/tcp

QID: 11827
Category: CGI
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/02/2025
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

This QID reports the absence of the following HTTP headers (https://www.owasp.org/index.php/OWASP_Secure-Headers_Project#tab=Headers) according to CWE-693: Protection Mechanism Failure (<https://cwe.mitre.org/data/definitions/693.html>):

X-Content-Type-Options: This HTTP header will prevent the browser from interpreting files as a different MIME type to what is specified in the Content-Type HTTP header.

Strict-Transport-Security: The HTTP Strict-Transport-Security response header (HSTS) allows web servers to declare that web browsers (or other complying user agents) should only interact with it using secure HTTPS connections, and never via the insecure HTTP protocol.

IMPACT:

Depending on the vulnerability being exploited, an unauthenticated remote attacker could conduct cross-site scripting, clickjacking or MIME-type sniffing attacks.

SOLUTION:

Note: To better debug the results of this QID, it is requested that customers execute commands to simulate the following functionality: `curl -lkl --verbose`.

CWE-693: Protection Mechanism Failure mentions the following - The product does not use or incorrectly uses a protection mechanism that provides sufficient defense against directed attacks against the product. A "missing" protection mechanism occurs when the application does not define any mechanism against a certain class of attack. An "insufficient" protection mechanism might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended. Finally, an "ignored" mechanism occurs when a mechanism is available and in active use within the product, but the developer has not applied it in some code path.

Customers are advised to set proper X-Content-Type-Options

(<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/X-Content-Type-Options>) and Strict-Transport-Security (<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Strict-Transport-Security>) HTTP response headers.

Depending on their server software, customers can set directives in their site configuration or Web.config files. Few examples are:

X-Content-Type-Options:

Apache: Header always set X-Content-Type-Options: nosniff

HTTP Strict-Transport-Security:

Apache: Header always set Strict-Transport-Security "max-age=31536000; includeSubDomains"

Nginx: `add_header Strict-Transport-Security max-age=31536000;`

Note: Network devices that include a HTTP/HTTPS console for administrative/management purposes often do not include all/some of the security headers. This is a known issue and it is recommend to contact the vendor for a solution.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

X-Content-Type-Options HTTP Header missing on port 80.

- 5 Apache Hypertext Transfer Protocol Server (HTTP Server) Multiple Security Vulnerabilities (CVE-2022-28330, CVE-2022-28614, CVE-2022-28615, CVE-2022-29404, CVE-2022-30556) port 80/tcp

QID: 731514
Category: CGI
Associated CVEs: [CVE-2022-28330](#), [CVE-2022-28614](#), [CVE-2022-28615](#), [CVE-2022-29404](#), [CVE-2022-30556](#)
Vendor Reference: [Apache_http_server](#)
Bugtraq ID: -
Service Modified: 08/20/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.

CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_lua's r:puts() function.

CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.

CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.

CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd

4 Apache Hypertext Transfer Protocol (HTTP) Server Buffer Overflow Vulnerability

port 80/tcp

QID: 730312
Category: CGI
Associated CVEs: [CVE-2021-44790](#)
Vendor Reference: [Apache HTTP Server Security Advisory](#)
Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody()) called from Lua scripts).

Affected Versions:

Apache HTTP Server 2.4.51 and earlier

IMPACT:

Successful exploitation of the vulnerability may allow remote code execution and complete system compromise.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.52 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

4 Apache Hypertext Transfer Protocol (HTTP) Server NULL Pointer Dereference and Server Side Request Forgery (SSRF) Vulnerability

port 80/tcp

QID: 730313

Category: CGI

Associated CVEs: [CVE-2021-44224](#)

Vendor Reference: [Apache Security Advisory](#)

Bugtraq ID: -

Service Modified: 04/06/2026

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Affected Versions:

Apache HTTP Server 2.4.7 - 2.4.51

IMPACT:

Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.52 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

| Bugtraq ID: | - | |
| Service Modified: | 04/06/2026 | |
| User Modified: | - | |
| Edited: | No | |
| PCI Vuln: | Yes | |

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.
CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling

CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.

CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:
Apache HTTP Server 2.4 - 2.4.52

IMPACT:

Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

4 Apache Hypertext Transfer Protocol (HTTP) Server Request Smuggling Vulnerability

port 80/tcp

QID: 730758

Category: CGI

Associated CVEs: [CVE-2023-25690](#)

Vendor Reference: [Apache HTTP Server Security Advisory](#)

Bugtraq ID: -

Service Modified: 06/17/2026

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:

Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html#2.4.56)

Patch:

4 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.55 Multiple Security Vulnerabilities

port 80/tcp

QID: 731513
Category: CGI
Associated CVEs: [CVE-2006-20001](#), [CVE-2022-37436](#)
Vendor Reference: [Apache_http_server](#)
Bugtraq ID: -
Service Modified: 08/20/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.

CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:

Apache HTTP Server versions prior to 2.4.55

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.

For further information, please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server. This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:
Apache HTTP Server versions prior to 2.4.58

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.
For further information, please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html).

Bugtraq ID: -
Service Modified: 07/22/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2024-38472: SSRF in Apache HTTP Server on Windows allows to potentially leak NTLM hashes to a malicious server via SSRF and malicious requests or content

CVE-2024-38473: Apache HTTP Server proxy encoding problem

CVE-2024-38474: Apache HTTP Server weakness with encoded question marks in backreferences

CVE-2024-38475: Apache HTTP Server weakness in mod_rewrite when first segment of substitution matches filesystem path.

CVE-2024-38476: Apache HTTP Server may use exploitable/malicious backend application output to run local handlers via internal redirect

CVE-2024-38477: Apache HTTP Server Crash resulting in Denial of Service in mod_proxy via a malicious request

CVE-2024-39573: Apache HTTP Server mod_rewrite proxy handler substitution

Affected Versions:

Apache HTTP Server versions prior to 2.4.60

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd

 4 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.64 Security Vulnerabilities (CVE-2024-47252)

port 80/tcp

QID: 732750

Category: CGI
Associated CVEs: [CVE-2024-47252](#)
Vendor Reference: [Apache_HTTP_Server_2.4.64](#)
Bugtraq ID: -
Service Modified: 04/23/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.
CVE-2024-47252: Apache HTTP Server: mod_ssl error log variable escaping
Affected Versions:
Apache httpd 2.4.x before 2.4.64

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)
Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

3 TCP Sequence Number Approximation Based Denial of Service

QID:	82054
Category:	TCP/IP
Associated CVEs:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Service Modified:	03/27/2025
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that

guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP (<http://packetstormsecurity.org/0404-advisories/246929.html>) details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 (<http://www.kb.cert.org/vuls/id/415294>) and OSVDB Article 4030 (<http://osvdb.org/4030>) to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 (<https://docs.microsoft.com/en-us/security-updates/securitybulletins/2005/ms05-019>) and MS06-064 (<https://docs.microsoft.com/en-us/security-updates/securitybulletins/2006/ms06-064>) for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P (<ftp://patches.sgi.com/support/free/security/advisories/20040905-01-P.asc>)

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14 (<ftp://ftp.sco.com/pub/updates/UnixWare/SCOSA-2005.14/SCOSA-2005.14.txt>)

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 (<http://www.kb.cert.org/vuls/id/JARL-5YGQAJ>) to obtain additional details. Also, refer to TA04-111A (<http://www.us-cert.gov/cas/techalerts/TA04-111A.html>) for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006 (<ftp://ftp.netbsd.org/pub/NetBSD/security/advisories/NetBSD-SA2004-006.txt.asc>)

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml (<http://www.cisco.com/warp/public/707/cisco-sa-20040420-tcp-ios.shtml>).

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230 (<https://www.ibm.com/support/pages/tcp-sequence-number-approximation-based-denial-service-cve-2004-0230>).

For Red Hat Linux: There is no fix available : Refer to (<https://access.redhat.com/security/cve/cve-2004-0230>).

Workaround: The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:

Secure Cisco IOS BGP Template (<http://www.cymru.com/Documents/secure-bgp-template.html>)

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Tested on port 80 with an injected SYN/RST offset by 16 bytes.

3 Apache Hypertext Transfer Protocol (HTTP) Server Response Smuggling Vulnerability

port 80/tcp

QID: 730765
Category: CGI
Associated CVEs: [CVE-2023-27522](#)
Vendor Reference: [Apache HTTP Server Security Advisory](#)
Bugtraq ID: -
Service Modified: 01/22/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

HTTP Response Smuggling vulnerability in Apache HTTP Server via mod_proxy_uwsgi. Special characters in the origin response header can truncate/split the response forwarded to the client.

Affected Versions:
This issue affects Apache HTTP Server: from 2.4.30 through 2.4.55

IMPACT:

Successful exploitation of the vulnerability may result in integrity impact.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html#2.4.56)

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html#2.4.56)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable version of Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:21:00 GMT

3 Apache Hypertext Transfer Protocol Server (HTTP Server) Multiple Security Vulnerabilities (CVE-2023-38709, CVE-2024-24795)

port 80/tcp

QID: 731355
Category: CGI
Associated CVEs: [CVE-2023-38709](#), [CVE-2024-24795](#)
Vendor Reference: [Apache_http_server](#)

Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2023-38709: Faulty input validation in the core of Apache allows malicious or exploitable backend/content generators to split HTTP responses.

CVE-2024-24795: HTTP Response splitting in multiple modules in Apache HTTP Server allows an attacker that can inject malicious response headers into backend applications to cause an HTTP desynchronization attack.

Affected Versions:
Apache HTTP Server versions prior to 2.4.59

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache versions respectively.
For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2026-24072: Apache HTTP Server: mod_rewrite elevation of privileges via ap_expr

Affected Versions:

Apache httpd 2.4.x before 2.4.67

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:21:00 GMT
Server: Apache/2.4.49 (Unix)

2 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.67 Security Vulnerabilities

port 80/tcp

QID: 734138
Category: CGI
Associated CVEs: [CVE-2026-28780](#)
Vendor Reference: [Apache_HTTP_Server_2.4.67](#)
Bugtraq ID: -
Service Modified: 07/15/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2026-28780: Apache HTTP Server: buffer overflow in mod_proxy_ajp via ajp_msg_check_header()

Affected Versions:

Apache httpd 2.4.x before 2.4.67

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd

For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

172.30.6.3	apache-path-traversal.labvulnerabilities_vulnnet

1 Host Scan Time - Scanner

QID: 45038
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/15/2022
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Scan duration: 1151 seconds

Start time: Thu, Jul 23 2026, 07:19:07 GMT

End time: Thu, Jul 23 2026, 07:38:18 GMT

1 Scan Activity per Port

QID: 45426
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/24/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

1 Open TCP Services List

QID: 82023
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -

Bugtraq ID: -
Service Modified: 11/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

1 ICMP Replies Received

QID: 82040
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/16/2003
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

COMPLIANCE:

1 HTTP method TRACE and/or TRACK Enabled

port 80/tcp

QID: 45033
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 05/27/2005
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The target Web server supports the TRACE and/or TRACK HTTP methods. These methods allow debugging and connection trace analysis for connections from the client to the Web server. Per the HTTP specification, when this method is used, the Web server echoes back the information sent to it by the client unmodified and unfiltered. Microsoft IIS Web server uses an alias TRACK for the TRACE method, and is functionally the same. The exact method(s) used are shown in the Results section.

IMPACT:

 1 Apache Default Installation/Welcome Page Detected

port 80/tcp

QID: 48065
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/21/2019
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Apache default installation or "Welcome" page is installed on this server. This usually indicates a newly installed server which has not yet been configured properly and which may not be known about.

IMPACT:

Apache is installed by default and the user may not be aware that the web server is running. These servers are rarely patched and rarely monitored, providing hackers with a convenient target that is not likely to trip any alarms.

SOLUTION:

Customers are recommended to disable default Apache welcome configuration.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Content-Type: text/html

1 Referrer-Policy HTTP Security Header Not Detected

port 80/tcp

QID: 48131
Category: Information gathering
Associated CVEs: -
Vendor Reference: [Referrer-Policy](#)
Bugtraq ID: -
Service Modified: 01/18/2023
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

- 1) no-referrer
- 2) no-referrer-when-downgrade
- 3) same-origin
- 4) origin
- 5) origin-when-cross-origin
- 6) strict-origin
- 7) strict-origin-when-cross-origin

IMPACT:

The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:

Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

- <https://www.w3.org/TR/referrer-policy/> (<https://www.w3.org/TR/referrer-policy/>)
- <https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Referrer-Policy> (<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Referrer-Policy>)

COMPLIANCE:

Not Applicable

1 Web Server Supports HTTP Request Pipelining

port 80/tcp

QID: 86565

Category:	Web server
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	02/22/2005
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:

Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker (<http://www.defcon.org/images/defcon-11/dc-11-presentations/dc-11-Roelker/dc-11-roelker-paper.pdf>), it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Splitting style attacks.

SOLUTION:

 1 Host Scan Time - Scanner

QID: 45038
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/15/2022
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

1 Scan Activity per Port

QID: 45426
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/24/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

 1 Open TCP Services List

QID: 82023
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

 1 ICMP Replies Received

QID: 82040
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/16/2003
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)
Timestamp Request (to trigger Timestamp Reply)
Address Mask Request (to trigger Address Mask Reply)
UDP Packet (to trigger Port Unreachable Reply)
IP Packet with Protocol >= 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

COMPLIANCE:

```

1 Default Web Page (Follow HTTP Redirection)

port 3000/tcp

QID: 13910
Category: CGI
Associated CVEs: -

Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/05/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Result section displays the default Web page for the Web server following HTTP redirections.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

GET / HTTP/1.1
Host: juice-shop.labvulnerabilities_vulnnet:3000
Connection: Keep-Alive

```

1 HTTP Response Method and Header Information Collected

port 3000/tcp

QID: 48118
 Category: Information gathering
 Associated CVEs: -
 Vendor Reference: -

Bugtraq ID: -
Service Modified: 07/20/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

This QID prints the information, in the form of a text record, that a web server sends back to a client's browser in response to receiving a single HTTP GET request.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

HTTP header and method information collected on port 3000.

GET / HTTP/1.1
Host: juice-shop.labvulnerabilities_vulnnet:3000
Connection: Keep-Alive

HTTP/1.1 200 OK
Access-Control-Allow-Origin: *
X-Content-Type-Options: nosniff
X-Frame-Options: SAMEORIGIN
Feature-Policy: payment 'self'
X-Recruiting: /#/jobs
Accept-Ranges: bytes
Cache-Control: public, max-age=0
Last-Modified: Thu, 23 Jul 2026 06:57:54 GMT
ETag: W/"26af-19f8dc438de"
Content-Type: text/html; charset=UTF-8
Content-Length: 9903
Vary: Accept-Encoding
Date: Thu, 23 Jul 2026 07:20:40 GMT
Connection: keep-alive
Keep-Alive: timeout=5

 1 Referrer-Policy HTTP Security Header Not Detected

port 3000/tcp

QID: 48131
Category: Information gathering
Associated CVEs: -
Vendor Reference: [Referrer-Policy](#)
Bugtraq ID: -

Service Modified: 01/18/2023
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

No Referrer Policy is specified for the link. It checks for one of the following Referrer Policy in the response headers:

- 1) no-referrer
- 2) no-referrer-when-downgrade
- 3) same-origin
- 4) origin
- 5) origin-when-cross-origin
- 6) strict-origin
- 7) strict-origin-when-cross-origin

IMPACT:

The Referrer-Policy header controls how much referrer information is sent to a site when navigating to it. Absence of Referrer-Policy header can lead to leakage of sensitive information via the referrer header.

SOLUTION:

Referrer Policy header improves security by ensuring websites don't leak sensitive information via the referrer header. It's recommended to add secure Referrer Policies as a part of a defense-in-depth approach.

References:

- <https://www.w3.org/TR/referrer-policy/> (<https://www.w3.org/TR/referrer-policy/>)
- <https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Referrer-Policy> (<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Referrer-Policy>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Referrer-Policy HTTP Header missing on 3000 port.
GET / HTTP/1.1
Host: juice-shop.labvulnerabilities_vulnnet:3000
Connection: Keep-Alive

1 Web Server Supports HTTP Request Pipelining

port 3000/tcp

QID: 86565
Category: Web server
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 02/22/2005
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:

Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker (<http://www.defcon.org/images/defcon-11/dc-11-presentations/dc-11-Roelker/dc-11-roelker-paper.pdf>), it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Splitting style attacks.

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

GET / HTTP/1.1
Host:172.30.7.1:3000

GET /Q_Evasive/ HTTP/1.1
Host:172.30.7.1:3000

1 Apache Default Foreign Language File Still on Server

port 3000/tcp

QID:	86743
Category:	Web server
Associated CVEs:	-
Vendor Reference:	-
Bugtraq ID:	-
Service Modified:	07/11/2006
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

Apache installs foreign language files along with index.html. The files are as follows:

index.html.ca
index.html.de
index.html.dk
index.html.ee

An attacker can get additional information about the Web server from these files.

IMPACT:

Sensitive system information may be disclosed, which can be utilized by an attacker to aid further attacks.

SOLUTION:

Apache recommends to remove these files from the Web server.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

GET /index.html.ru.iso-ru HTTP/1.1
Host: juice-shop.labvulnerabilities_vulnnet:3000
Connection: Keep-Alive

172.30.9.1 (dvwa.labvulnerabilities_vulnnet, -)

Potential Vulnerabilities (53)

	5	Apache httpd Server Uninitialized memory reflection in mod_auth_digest Information Disclosure Vulnerability	port 80/tcp
QID:	87555		
Category:	Web server		
Associated CVEs:	CVE-2017-9788		
Vendor Reference:	Apache HTTP Server Security Advisory		
Bugtraq ID:	-		
Service Modified:	09/23/2025		
User Modified:	-		
Edited:	No		
PCI Vuln:	Yes		

THREAT:

Apache Web Server is an open-source web server.

Uninitialized memory reflection in mod_auth_digest leading to leakage of potentially confidential information, and a segfault.

Affected Versions:

Apache httpd 2.2.x before 2.2.34
Apache httpd 2.4.x before 2.4.27

IMPACT:

Successful exploitation of this vulnerability may allow an attacker to make the targeted server unavailable and cause denial of service.

SOLUTION:

Customers are advised to upgrade to Apache httpd 2.2.34, 2.4.27 (<https://httpd.apache.org/download.cgi>) or later versions to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache httpd 2.2.34, 2.4.27 or later (<https://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 5 Apache Hypertext Transfer Protocol Server (HTTP Server) Multiple Security Vulnerabilities (CVE-2022-28330, CVE-2022-28614, CVE-2022-28615, CVE-2022-29404, CVE-2022-30556) port 80/tcp

QID:	731514
Category:	CGI
Associated CVEs:	CVE-2022-28330 , CVE-2022-28614 , CVE-2022-28615 , CVE-2022-29404 , CVE-2022-30556
Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Service Modified:	08/20/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.

CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_lua's r:puts() function.

CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.

CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.

CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:

Apache HTTP Server versions 2.4.53 and earlier

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd

For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

4 Apache httpd Server Information Disclosure Vulnerability (OptionsBleed)

QID:	87310
Category:	Web server
Associated CVEs:	CVE-2017-9798
Vendor Reference:	Apache httpd 2.4.28
Bugtraq ID:	100872,105598
Service Modified:	03/12/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache Web Server is an open-source web server.

On systems with the Limit directive set within a '.htaccess' file and set to an invalid HTTP method, a remote user can send a specially crafted HTTP OPTIONS request for a path to trigger a use-after-free memory error and view potentially sensitive information from process memory on the target system.

This vulnerability is referred to as "Optionsbleed".

Apache HTTP Server through 2.2.34 and 2.4.x through 2.4.27

IMPACT:

A remote user can obtain potentially sensitive information on the target system in certain cases.

SOLUTION:

The Apache HTTP Project released patch version (2.4.28) to resolve this issue.

Refer to Apache security advisory CVE-2017-9798. (https://httpd.apache.org/security/vulnerabilities_24.html)

If you are using a Linux distribution, please refer to your Linux vendor for further information and updates.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Reference: CVE-2017-9798

Description: Apache httpd allows remote attackers to read secret data from process memory if the Limit directive can be set in a user's .htaccess file, or if httpd.conf has certain misconfigurations, aka Optionsbleed. This affects the Apache HTTP Server through 2.2.34 and 2.4.x through 2.4.27. The attacker sends an unauthenticated OPTIONS HTTP request when attempting to read secret

data. This is a use-after-free issue and thus secret data is not always sent, and the specific data depends on many factors incl

4 Apache HTTP Server Privilege Escalation From Modules Scripts

QID: 87383

Category: Web server

Associated CVEs: [CVE-2019-0211](#), [CVE-2019-0217](#), [CVE-2019-0215](#), [CVE-2019-0197](#), [CVE-2019-0196](#), [CVE-2019-0220](#)

Vendor Reference: [Fixed in Apache httpd 2.4.39](#)

Bugtraq ID: 107666

Service Modified: 06/03/2026

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

In Apache HTTP Server 2.4 releases 2.4.17 to 2.4.38, with MPM event, worker or prefork, code executing in less-privileged child processes or threads (including scripts executed by an in-process scripting interpreter) could execute arbitrary code with the privileges of the parent process (usually root) by manipulating the scoreboard. Non-Unix systems are not affected.

Affected Versions:

2.4.38, 2.4.37, 2.4.35, 2.4.34, 2.4.33, 2.4.30, 2.4.29, 2.4.28, 2.4.27, 2.4.26, 2.4.25, 2.4.23, 2.4.20, 2.4.18, 2.4.17

IMPACT:

Successful exploitation allows a remote attacker to use this vulnerability to execute arbitrary code with the privileges of the parent process.

SOLUTION:

This vulnerability have been patched in Apache. Refer to Apache httpd 2.4.39 Changelog (https://httpd.apache.org/security/vulnerabilities_24.html) or your Linux distro for further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

4 Apache HTTP Server mod_mime Buffer Overread

QID: 89009
Category: Web server
Associated CVEs: [CVE-2017-7679](#)
Vendor Reference: [Apache httpd 2.4.26](#), [Apache httpd 2.2.34](#)
Bugtraq ID: 99170
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Apache Module mod_mime is used to assign content metadata to the content selected for an HTTP response by mapping patterns in the URI or filenames to the metadata values.

In Apache httpd 2.2.x before 2.2.33 and 2.4.x before 2.4.26, mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

IMPACT:

A remote attacker could exploit this vulnerability to read one byte past the end of a buffer which could affect the confidentiality, integrity and availability of data on the target system.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to Apache httpd 2.4.27 Changelog (https://httpd.apache.org/security/vulnerabilities_24.html), Apache httpd 2.2.34 Changelog (https://httpd.apache.org/security/vulnerabilities_22.html), or your Linux distro for further details.

Patch:

THREAT:

Apache HTTP Server is an HTTP web server application.

Affected Versions:
Apache HTTP Server versions prior to 2.4.46.

NOTE:
CVE-2021-26691, CVE-2021-26690, CVE-2020-35452, CVE-2020-13938 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41, 2.4.39, 2.4.38, 2.4.37, 2.4.35, 2.4.34, 2.4.33, 2.4.29, 2.4.28, 2.4.27, 2.4.26, 2.4.25, 2.4.23, 2.4.20, 2.4.18, 2.4.17, 2.4.16, 2.4.12, 2.4.10, 2.4.9, 2.4.7, 2.4.6, 2.4.4, 2.4.3, 2.4.2, 2.4.1, 2.4.0.
CVE-2019-17567 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41, 2.4.39, 2.4.38, 2.4.37, 2.4.35, 2.4.34, 2.4.33, 2.4.29, 2.4.28, 2.4.27, 2.4.26, 2.4.25, 2.4.23, 2.4.20, 2.4.18, 2.4.17, 2.4.16, 2.4.12, 2.4.10, 2.4.9, 2.4.7, 2.4.6
CVE-2021-30641 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41, 2.4.39
CVE-2020-13950 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41

IMPACT:

Successful exploitation of this vulnerability may allow an attacker to execute arbitrary code on the target.

SOLUTION:

Customers are advised to update Apache httpd 2.4.48.
For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

vulncheck-ransomware

Reference: CVE-2021-40438
Description: Ryuk
Link: <https://info.securin.io/hubfs/Securin%20Ransomware%20Report%202023.pdf>

ASSOCIATED MALWARE:

Qualys Cloud Threat DB

Malware ID: Ryuk
Type: Ransomware
Link: <https://info.securin.io/hubfs/Securin%20Ransomware%20Report%202023.pdf>

RESULTS:

Vulnerable Version of Apache HTTP Server Detected on port: 80
Server: Apache/2.4.25 (Debian)

4 Apache Hypertext Transfer Protocol (HTTP) Server Buffer Overflow Vulnerability

port 80/tcp

QID: 730312
Category: CGI
Associated CVEs: [CVE-2021-44790](#)
Vendor Reference: [Apache HTTP Server Security Advisory](#)
Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0. A carefully crafted request body can cause a buffer overflow in the mod_lua multipart parser (r:parsebody() called from Lua scripts).
Affected Versions:

Apache HTTP Server 2.4.51 and earlier

IMPACT:

Successful exploitation of the vulnerability may allow remote code execution and complete system compromise.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.52 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

exploitdb

Vendor Reference: [Apache Security Advisory](#)
Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

A crafted URI sent to httpd configured as a forward proxy (ProxyRequests on) can cause a crash (NULL pointer dereference) or, for configurations mixing forward and reverse proxy declarations, can allow for requests to be directed to a declared Unix Domain Socket endpoint (Server Side Request Forgery).

Affected Versions:
Apache HTTP Server 2.4.7 - 2.4.51

IMPACT:

Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.52 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:
Following are links for downloading patches to fix the vulnerabilities:

 4 Apache Hypertext Transfer Protocol (HTTP) Server Out-of-bounds Write Vulnerability

port 80/tcp

QID: 730403

Category: CGI
Associated CVEs: [CVE-2022-23943](#), [CVE-2022-22721](#), [CVE-2022-22720](#), [CVE-2022-22719](#)
Vendor Reference: [Apache Security Advisory](#)
Bugtraq ID: -
Service Modified: 04/06/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

CVE-2022-22719 - A carefully crafted request body can cause a read to a random memory area which could cause the process to crash.

CVE-2022-22720 - Apache HTTP Server 2.4.52 and earlier fails to close inbound connection when errors are encountered discarding the request body, exposing the server to HTTP Request Smuggling

CVE-2022-22721 - If LimitXMLRequestBody is set to allow request bodies larger than 350MB (defaults to 1M) on 32 bit systems an integer overflow happens which later causes out of bounds writes.

CVE-2022-23943 - Out-of-bounds Write vulnerability in mod_sed of Apache HTTP Server allows an attacker to overwrite heap memory with possibly attacker provided data.

Affected Versions:

Apache HTTP Server 2.4 - 2.4.52

IMPACT:

Successful exploitation of the vulnerability may allow an attacker to redirect victim to a malicious server.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.53 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Associated CVEs: [CVE-2023-25690](#)
Vendor Reference: [Apache HTTP Server Security Advisory](#)
Bugtraq ID: -
Service Modified: 06/17/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.

Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution.

Affected Versions:

Apache HTTP Server Versions 2.4.0 through 2.4.55 (including)

IMPACT:

Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning.

SOLUTION:

Customers are advised to upgrade to Apache HTTP Server version 2.4.56 or later. For more information please refer to [Apache HTTP Server Security Advisory \(https://httpd.apache.org/security/vulnerabilities_24.html#2.4.56\)](https://httpd.apache.org/security/vulnerabilities_24.html#2.4.56)

Patch:

4 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.55 Multiple Security Vulnerabilities

port 80/tcp

QID: 731513
Category: CGI
Associated CVEs: [CVE-2006-20001](#), [CVE-2022-37436](#)
Vendor Reference: [Apache_http_server](#)
Bugtraq ID: -
Service Modified: 08/20/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2006-20001: A carefully crafted If: request header can cause a memory read, or write of a single zero byte, in a pool (heap) memory location beyond the header value sent. This could cause the process to crash.

CVE-2022-37436: A malicious backend can cause the response headers to be truncated early, resulting in some headers being incorporated into the response body. If the later headers have any security purpose, they will not be interpreted by the client.

Affected Versions:

Apache HTTP Server versions prior to 2.4.55

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache HTTP Server versions 2.4.55 or later.
For further information, please refer to Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP Server Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Associated CVEs:	CVE-2023-31122 , CVE-2023-45802		
Vendor Reference:	Apache_http_server		
Bugtraq ID:	-		
Service Modified:	04/21/2026		
User Modified:	-		
Edited:	No		
PCI Vuln:	No		

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2023-31122: Out-of-bounds Read vulnerability in mod_macro of Apache HTTP Server. This issue affects Apache HTTP Server
CVE-2023-45802: A client could send new requests and resets, keeping the connection busy and open and causing the memory footprint to keep on growing. On connection close, all resources were reclaimed, but the process might run out of memory before that.

Affected Versions:

Apache HTTP Server versions prior to 2.4.58

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache HTTP Server versions 2.4.58 or later.

3 TCP Sequence Number Approximation Based Denial of Service

QID:	82054
Category:	TCP/IP
Associated CVEs:	CVE-2004-0230
Vendor Reference:	-
Bugtraq ID:	10183
Service Modified:	03/27/2025
User Modified:	-
Edited:	No
PCI Vuln:	No

THREAT:

TCP provides stateful communications between hosts on a network. TCP sessions are established by a three-way handshake and use random 32-bit sequence and acknowledgement numbers to ensure the validity of traffic. A vulnerability was reported that may permit TCP sequence numbers to be more easily approximated by remote attackers. This issue affects products released by multiple vendors.

The cause of the vulnerability is that affected implementations will accept TCP sequence numbers within a certain range, known as the acknowledgement range, of the expected sequence number for a packet in the session. This is determined by the TCP window size, which is negotiated during the three-way handshake for the session. Larger TCP window sizes may be set to allow for more throughput, but the larger the TCP window size, the more probable it is to guess a TCP sequence number that falls within an acceptable range. It was initially thought that guessing an acceptable sequence number was relatively difficult for most implementations given random distribution, making this type of attack impractical. However, some implementations may make it easier to successfully approximate an acceptable TCP sequence number, making these attacks possible with a number of protocols and implementations.

This is further compounded by the fact that some implementations may support the use of the TCP Window Scale Option, as described in RFC 1323, to extend the TCP window size to a maximum value of 1 billion.

This vulnerability will permit a remote attacker to inject a SYN or RST packet into the session, causing it to be reset and effectively allowing for denial of service attacks. An attacker would exploit this issue by sending a packet to a receiving implementation with an approximated sequence number and a forged source IP address and TCP port.

There are a few factors that may present viable target implementations, such as those which depend on long-lived TCP connections, those that have known or easily guessed IP address endpoints and those implementations with easily guessed TCP source ports. It has been noted that Border Gateway Protocol (BGP) is reported to be particularly vulnerable to this type of attack, due to the use of long-lived TCP sessions and the possibility that some implementations may use the TCP Window Scale Option. As a result, this issue is likely to affect a number of routing platforms.

Another factor to consider is the relative difficulty of injecting packets into TCP sessions, as a number of receiving implementations will reassemble packets in order, dropping any duplicates. This may make some implementations more resistant to attacks than others.

It should be noted that while a number of vendors have confirmed this issue in various products, investigations are ongoing and it is likely that many other vendors and products will turn out to be vulnerable as the issue is investigated further.

IMPACT:

Successful exploitation of this issue could lead to denial of service attacks on the TCP based services of target hosts.

SOLUTION:

Please first check the results section below for the port number on which this vulnerability was detected. If that port number is known to be used for port-forwarding, then it is the backend host that is really vulnerable.

Various implementations and products including Check Point, Cisco, Cray Inc, Hitachi, Internet Initiative Japan, Inc (IIJ), Juniper Networks, NEC and Yamaha are currently undergoing review. Contact the vendors to obtain more information about affected products and fixes. NISCC Advisory 236929 - Vulnerability Issues in TCP (<http://packetstormsecurity.org/0404-advisories/246929.html>) details the vendor patch status as of the time of the advisory, and identifies resolutions and workarounds.

Refer to US-CERT Vulnerability Note VU#415294 (<http://www.kb.cert.org/vuls/id/415294>) and OSVDB Article 4030 (<http://osvdb.org/4030>) to obtain a list of vendors affected by this issue and a note on resolutions (if any) provided by the vendor.

For Microsoft: Refer to MS05-019 (<https://docs.microsoft.com/en-us/security-updates/securitybulletins/2005/ms05-019>) and MS06-064 (<https://docs.microsoft.com/en-us/security-updates/securitybulletins/2006/ms06-064>) for further details.

For SGI IRIX: Refer to SGI Security Advisory 20040905-01-P (<ftp://patches.sgi.com/support/free/security/advisories/20040905-01-P.asc>)

For SCO UnixWare 7.1.3 and 7.1.1: Refer to SCO Security Advisory SCOSA-2005.14 (<ftp://ftp.sco.com/pub/updates/UnixWare/SCOSA-2005.14/SCOSA-2005.14.txt>)

For Solaris (Sun Microsystems): The vendor has acknowledged the vulnerability; however a patch is not available. Refer to Sun Microsystems, Inc. Information for VU#415294 (<http://www.kb.cert.org/vuls/id/JARL-5YGQAJ>) to obtain additional details. Also, refer to TA04-111A (<http://www.us-cert.gov/cas/techalerts/TA04-111A.html>) for detailed mitigating strategies against these attacks.

For NetBSD: Refer to NetBSD-SA2004-006 (<ftp://ftp.netbsd.org/pub/NetBSD/security/advisories/NetBSD-SA2004-006.txt.asc>)

For Cisco: Refer to cisco-sa-20040420-tcp-ios.shtml (<http://www.cisco.com/warp/public/707/cisco-sa-20040420-tcp-ios.shtml>).

For IBM : Refer to IBM-tcp-sequence-number-cve-2004-0230 (<https://www.ibm.com/support/pages/tcp-sequence-number-approximation-based-denial-service-cve-2004-0230>).

For Red Hat Linux: There is no fix available : Refer to (<https://access.redhat.com/security/cve/cve-2004-0230>).

Workaround: The following BGP-specific workaround information has been provided.

For BGP implementations that support it, the TCP MD5 Signature Option should be enabled. Passwords that the MD5 checksum is applied to should be set to strong values and changed on a regular basis.

Secure BGP configuration instructions have been provided for Cisco and Juniper at these locations:

Secure Cisco IOS BGP Template (<http://www.cymru.com/Documents/secure-bgp-template.html>)

JUNOS Secure BGP Template (<http://www.cymru.com/gillsr/documents/junos-bgp-template.pdf>)

There is no malware information for this vulnerability.

RESULTS:

Tested on port 80 with an injected SYN/RST offset by 16 bytes.

3 Apache httpd Server ap_get_basic_auth_pw() Authentication Bypass Vulnerability

QID: 87322
 Category: Web server
 Associated CVEs: [CVE-2017-3167](#), [CVE-2017-3169](#)
 Vendor Reference: [Apache httpd 2.4.26](#)
 Bugtraq ID: 99135
 Service Modified: 06/26/2024
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

Apache Web Server is an open-source web server.

The use of the `ap_get_basic_auth_pw()` by third-party modules outside of the authentication phase may lead to authentication requirements being bypassed in vulnerable Apache httpd versions.

Affected Versions:
Apache httpd 2.2.x before 2.2.33
Apache httpd 2.4.x before 2.4.26

IMPACT:

Successful exploitation allows remote attackers to bypass authentication and access sensitive information.

SOLUTION:

Customers are advised to upgrade to Apache httpd 2.2.33, 2.4.26 (<https://httpd.apache.org/download.cgi>) or later versions to remediate this vulnerability.

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache httpd 2.2.33, 2.4.26 or later (<https://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable version of Apache HTTP Server detected on port 80 -

3	Apache HTTP Server multiple vulnerabilities	port 80/tcp
QID:	13745	
Category:	CGI	
Associated CVEs:	CVE-2020-1934 , CVE-2020-1927	
Vendor Reference:	Apache HTTP Server	
Bugtraq ID:	-	
Service Modified:	04/06/2026	
User Modified:	-	
Edited:	No	
PCI Vuln:	Yes	

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2020-1934: In Apache HTTP Server, `mod_proxyftp` may use uninitialized memory when proxying to a malicious FTP server.

CVE-2020-1927: In Apache HTTP Server, redirects configured with mod_rewrite that were intended to be self-referential might be fooled by encoded newlines and redirect instead to an an unexpected URL within the request URL.

Affected Versions:
Apache httpd 2.4.0 to 2.4.41

IMPACT:

This vulnerability could be exploited to gain partial access to sensitive information. Malicious users could also use this vulnerability to change partial contents or configuration on the system

SOLUTION:

Customers are advised to update Apache httpd to 2.4.42 or later.
For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache httpd 2.4.42 or later 2.4. (<https://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:21:30 GMT

3 Apache Hypertext Transfer Protocol Server (HTTP Server) Multiple Security Vulnerabilities (CVE-2023-38709, CVE-2024-24795)

port 80/tcp

QID:	731355
Category:	CGI
Associated CVEs:	CVE-2023-38709 , CVE-2024-24795
Vendor Reference:	Apache_http_server
Bugtraq ID:	-
Service Modified:	04/06/2026
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2023-38709: Faulty input validation in the core of Apache allows malicious or exploitable backend/content generators to split HTTP responses.

CVE-2024-24795: HTTP Response splitting in multiple modules in Apache HTTP Server allows an attacker that can inject malicious response headers

into backend applications to cause an HTTP desynchronization attack.

Affected Versions:
Apache HTTP Server versions prior to 2.4.59

IMPACT:

Successful exploitation of this vulnerability may result in the breach of Confidentiality, Integrity, and Availability of data.

SOLUTION:

Customers are advised to update the latest Apache versions respectively.
For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

 nist-nvd2
Reference: CVE-2026-49975
Description: Memory Allocation with Excessive Size Value vulnerability in Apache HTTP Server's mod_http leads to denial of service via malicious HTTP requests.

This issue affects Apache HTTP Server: from 2.4.17 through 2.4.67.
Link: <https://github.com/EQSTLab/CVE-2026-49975>

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:21:30 GMT
Server: Apache/2.4.25 (Debian)
Set-Cookie: PHPSESSID=15ou28gdrmm4mftf1t499gql74; path=/

Content-Type: text/html; charset=UTF-8

 3 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.68 Security Vulnerabilities (CVE-2026-34355)

port 80/tcp

QID: 734382
Category: CGI
Associated CVEs: [CVE-2026-34355](#)
Vendor Reference: [Apache_HTTP_Server_2.4.68](#)
Bugtraq ID: -
Service Modified: 06/15/2026
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2026-34355: mod_proxy_html buffer overflow

Affected Versions:

Apache httpd 2.4.x before 2.4.68

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd

For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

2 Apache Hypertext Transfer Protocol Server (HTTP Server) HTTP/2 Method Injection Vulnerability

port 80/tcp

QID:	730210
Category:	CGI
Associated CVEs:	CVE-2021-33193
Vendor Reference:	Apache HTTP Server Security Advisory
Bugtraq ID:	-
Service Modified:	08/20/2024
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

A crafted method sent through HTTP/2 will bypass validation and be forwarded by mod_proxy, which can lead to request splitting or cache poisoning.

Affected Versions:
Apache HTTP Server 2.4.17 to 2.4.48.

IMPACT:

Successful exploitation of this vulnerability may allow request splitting or cache poisoning.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.49 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

2 Apache Hypertext Transfer Protocol Server (HTTP Server) Prior to 2.4.68 Security Vulnerabilities (CVE-2026-29167)

port 80/tcp

QID: 734377
Category: CGI
Associated CVEs: [CVE-2026-29167](#)
Vendor Reference: [Apache_HTTP_Server_2.4.68](#)
Bugtraq ID: -
Service Modified: 06/16/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.

CVE-2026-29167: mod_ldap per-dir use-after-free

Affected Versions:
Apache httpd 2.4.x before 2.4.68

IMPACT:

Successful exploitation of this vulnerability may compromise the confidentiality, integrity, or availability of the data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information please refer to Apachehttpserver (https://httpd.apache.org/security/vulnerabilities_24.html)

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:21:30 GMT

1 Host Scan Time - Scanner

QID: 45038
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 09/15/2022
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The Host Scan Time is the period of time it takes the scanning engine to perform the vulnerability assessment of a single target host. The Host Scan Time for this host is reported in the Result section below.

The Host Scan Time does not have a direct correlation to the Duration time as displayed in the Report Summary section of a scan results report. The Duration is the period of time it takes the service to perform a scan task. The Duration includes the time it takes the service to scan all hosts, which may involve parallel scanning. It also includes the time it takes for a scanner appliance to pick up the scan task and transfer the results back to the service's Secure Operating Center. Further, when a scan task is distributed across multiple scanners, the Duration includes the time it takes to perform parallel host scanning on all scanners.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

1 Scan Activity per Port

QID: 45426
Category: Information gathering
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 06/24/2020
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Scan activity per port is an estimate of the amount of internal process time the scanner engine spent scanning a particular TCP or UDP port. This information can be useful to determine the reason for long scan times. The individual time values represent internal process time, not elapsed time, and can be longer than the total scan time because of internal parallelism. High values are often caused by slowly responding services or services on which requests time out.

IMPACT:

N/A

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

1 Open TCP Services List

QID: 82023
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 11/19/2025
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

The port scanner enables unauthorized users with the appropriate tools to draw a map of all services on this host that can be accessed from the Internet. The test was carried out with a "stealth" port scanner so that the server does not log real connections.

The Results section displays the port number (Port), the default service listening on the port (IANA Assigned Ports/Services), the description of the service (Description) and the service that the scanner detected using service discovery (Service Detected).

IMPACT:

Unauthorized users can exploit this information to test vulnerabilities in each of the open services.

SOLUTION:

Shut down any unknown or unused service on the list. If you have difficulty figuring out which service is provided by which process or program, contact your provider's support team. For more information about commercial and open-source Intrusion Detection Systems available for detecting port scanners of this kind, visit the CERT Web site (<http://www.cert.org>).

COMPLIANCE:

1 ICMP Replies Received

QID: 82040
Category: TCP/IP
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 01/16/2003
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

ICMP (Internet Control and Error Message Protocol) is a protocol encapsulated in IP packets. ICMP's principal purpose is to provide a protocol layer that informs gateways of the inter-connectivity and accessibility of other gateways or hosts.

We have sent the following types of packets to trigger the host to send us ICMP replies:

Echo Request (to trigger Echo Reply)

Timestamp Request (to trigger Timestamp Reply)

Address Mask Request (to trigger Address Mask Reply)

UDP Packet (to trigger Port Unreachable Reply)

IP Packet with Protocol ≥ 250 (to trigger Protocol Unreachable Reply)

Listed in the "Result" section are the ICMP replies that we have received.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

ICMP Reply Type	Triggered By	Additional Information
Unreachable (type=3 code=3)	UDP Port 1604	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 1028	Port Unreachable
Echo (type=0 code=0)	Echo Request	Echo Reply
Unreachable (type=3 code=3)	UDP Port 1046	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 1	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 9873	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 37230	Port Unreachable
Unreachable (type=3 code=3)	UDP Port 858	Port Unreachable
Time Stamp (type=14 code=0)	Time Stamp Request	07:19:10 GMT
Unreachable (type=3 code=3)	UDP Port 4590	Port Unreachable

1 Web Server Supports HTTP Request Pipelining

port 80/tcp

QID: 86565
Category: Web server
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 02/22/2005
User Modified: -
Edited: No
PCI Vuln: No

THREAT:

Version 1.1 of the HTTP protocol supports URL-Request Pipelining. This means that instead of using the "Keep-Alive" method to keep the TCP connection alive over multiple requests, the protocol allows multiple HTTP URL requests to be made in the same TCP packet. Any Web server which is HTTP 1.1 compliant should then process all the URLs requested in the single TCP packet and respond as usual.

The target Web server was found to support this functionality of the HTTP 1.1 protocol.

IMPACT:

Support for URL-Request Pipelining has interesting consequences. For example, as explained in this paper by Daniel Roelker (<http://www.defcon.org/images/defcon-11/dc-11-presentations/dc-11-Roelker/dc-11-roelker-paper.pdf>), it can be used for evading detection by Intrusion Detection Systems. Also, it can be used in HTTP Response-Splitting style attacks.

SOLUTION:

N/A

COMPLIANCE:

Not Applicable

Edited: No
PCI Vuln: Yes

THREAT:

A configuration file for web applications was detected, containing data about how the web application will act. This file may also include information about module loading, security configuration, session state configuration, and application language and compilation settings and other application specific items such as database connection strings.

IMPACT:

Successful exploitation allows a remote unauthenticated attacker to get configuration information specific to the target that may aid in launching further attacks.

SOLUTION:

There is no exact solution available for this.

Workaround: Customers are advised to prevent public access of the web.config file by applying appropriate security restrictions.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

web.config file found on port 80.

3 phpinfo Information Disclosure Vulnerability

port 80/tcp

QID: 10464
Category: CGI
Associated CVEs: -
Vendor Reference: -
Bugtraq ID: -
Service Modified: 07/18/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

This host has a publicly-accessible PHP file that calls the phpinfo() function (or some other function similar to it).

If a user requests this file (such as via an Internet browser), the user may obtain a page containing sensitive information about the Web server host. The information displayed to the user could include the exact version numbers of various software products (Operating Systems, Web Servers, PHP, XML, MySQL), the values of some environment variables (\$PATH, \$SYSTEM_ROOT), paths to various programs (cmd.exe), and much more.

To get specific information about the type of data your host displayed, please refer to the "Result" field below.

IMPACT:

By exploiting this vulnerability, any user could obtain very sensitive information about the Web server host. This information may aid in attacks against the host.

SOLUTION:

You should immediately remove all such files from the public domain on your Web server.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

HTTP/1.1 200 OK
Date: Thu, 23 Jul 2026 07:21:45 GMT
Server: Apache/2.4.7 (Ubuntu)
X-Powered-By: PHP/5.5.9-1ubuntu4.14
Vary: Accept-Encoding
Keep-Alive: timeout=5, max=92
Connection: Keep-Alive
Transfer-Encoding: chunked
Content-Type: text/html

```

2 Web Directories Listable Vulnerability

port 80/tcp

QID: 86445
 Category: Web server
 Associated CVEs: -
 Vendor Reference: -
 Bugtraq ID: -
 Service Modified: 04/17/2019
 User Modified: -
 Edited: No
 PCI Vuln: Yes

THREAT:

The Web server has some listable directories. Very sensitive information can be obtained from directory listings.

IMPACT:

A remote user may exploit this vulnerability to obtain very sensitive information on the host. The information obtained may assist in further attacks against the host.

SOLUTION:

Disable directory browsing or listing for all directories.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Listable Directories

/db/

/js/

/apps/

Potential Vulnerabilities (102)

5 libxml2 Multiple Vulnerabilities

QID:	11803
Category:	CGI
Associated CVEs:	CVE-2015-8806 , CVE-2016-1762 , CVE-2016-1833 , CVE-2016-1834 , CVE-2016-1835 , CVE-2016-1836 , CVE-2016-1837 , CVE-2016-1838 , CVE-2016-1839 , CVE-2016-1840 , CVE-2016-2073 , CVE-2016-3705 , CVE-2016-4447 , CVE-2016-4448 , CVE-2016-4449 , CVE-2016-4483
Vendor Reference:	libxml2
Bugtraq ID:	90865,82071,85267,89854,90864,90856,90013,85059,90696,90691
Service Modified:	09/30/2025
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

libxml2 is prone to multiple vulnerabilities:-

1. The xmlNextChar function in libxml2 before 2.9.4 allows remote attackers to cause a denial of service (heap-based buffer over-read) via a crafted XML document. (CVE-2016-1762)
2. The xmlParserPrintFileContextInternal function in libxml2 allows remote attackers to cause a denial of service (heap-based buffer over-read) via a crafted XML document. (CVE-2016-1838)
3. Multiple use-after-free vulnerabilities in the (1) htmlParsePubidLiteral and (2) htmlParseSystemliteral functions in libxml2 allow remote attackers to cause a denial of service via a crafted XML document. (CVE-2016-1837)
4. Use-after-free vulnerability in the xmlDictComputeFastKey function in libxml2 allows remote attackers to cause a denial of service via a crafted XML document. (CVE-2016-1836)
5. Use-after-free vulnerability in the xmlSAX2AttributeNs function in libxml2 allows remote attackers to cause a denial of service via a crafted XML document. (CVE-2016-1835)
6. Heap-based buffer overflow in the xmlStrncat function in libxml2 allows remote attackers to execute arbitrary code or cause a denial of service (memory corruption) via a crafted XML document. (CVE-2016-1834)
7. The htmlCurrentChar function in libxml2 allows remote attackers to cause a denial of service (heap-based buffer over-read) via a crafted XML document. (CVE-2016-1833)
8. The xmlNextChar function in libxml2 allows remote attackers to cause a denial of service (heap-based buffer over-read) via a crafted XML document. (CVE-2016-1762)
9. dict.c in libxml2 allows remote attackers to cause a denial of service (heap-based buffer over-read and application crash) via an unexpected character in a crafted HTML document. (CVE-2015-8806)

10. The xmlDictAddString function in libxml2 allows remote attackers to cause a denial of service (heap-based buffer over-read) via a crafted XML document. (CVE-2016-1839)
11. Heap-based buffer overflow in the xmlFAParsePosCharGroup function in libxml2 allows remote attackers to execute arbitrary code or cause a denial of service (memory corruption) via a crafted XML document. (CVE-2016-1840)
12. The htmlParseNameComplex function in HTMLparser.c in libxml2 allows attackers to cause a denial of service (out-of-bounds read) via a crafted XML document. (CVE-2016-2073)
13. The (1) xmlParserEntityCheck and (2) xmlParseAttValueComplex functions in parser.c in libxml2 do not properly keep track of the recursion depth, which allows context-dependent attackers to cause a denial of service (stack consumption and application crash) via a crafted XML document containing a large number of nested entity references. (CVE-2016-3705)
14. The xmlParseElementDecl function in parser.c in libxml2 allows context-dependent attackers to cause a denial of service (heap-based buffer underread and application crash) via a crafted file, involving xmlParseName. (CVE-2016-4447)
15. Format string vulnerability in libxml2 allows attackers to have unspecified impact via format string specifiers in unknown vectors. (CVE-2016-4448)
16. XML external entity (XXE) vulnerability in the xmlStringLenDecodeEntities function in parser.c in libxml2, when not in validating mode, allows context-dependent attackers to read arbitrary files or cause a denial of service (resource consumption) via unspecified vectors. (CVE-2016-4449)
17. The xmlBufAttrSerializeTxtContent function in xmlsave.c in libxml2 allows context-dependent attackers to cause a denial of service (out-of-bounds read and application crash) via a non-UTF-8 attribute value, related to serialization. (CVE-2016-4483)

Versions Affected:-

libxml2 versions prior to 2.9.4

IMPACT:

Successful exploitation allows remote attackers to cause a denial of service via an unexpected character in a crafted HTML document.

SOLUTION:

Refer to libxml2 repository libxml2 (<http://xmlsoft.org/downloads.html>) to obtain further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

libxml2 (<http://xmlsoft.org/downloads.html>)

5 EOL/Obsolete Software: Hypertext Preprocessor (PHP) 5.5.x Detected

QID: 105675
Category: Security Policy
Associated CVEs: -
Vendor Reference: [PHP End of Life](#)
Bugtraq ID: -
Service Modified: 09/06/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is suited for web development and can be embedded in HTML.

PHP 5.5 series reached End of Life in its support cycle on July 21, 2016.

Since there are no further bug fixes or security updates for PHP 5.5 series, it's highly recommended to migrate from version 5.5 to newer supported versions.

Affected Versions:
PHP 5.5.x versions

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

Upgrade to 5.6 or later. For more information, please refer to the PHP 5.5 to PHP 5.6 Migration Guide (<http://php.net/migration56>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

QID: 105675 detected on port 80 over TCP -
Date: Thu, 23 Jul 2026 07:21:30 GMT
Server: Apache/2.4.7 (Ubuntu)
X-Powered-By: PHP/5.5.9-1ubuntu4.14
Location: portal.php
Content-Length: 0
Connection: close
Content-Type: text/html

5 EOL/Obsolete Software: MySQL 5.5.x Detected

QID:	105820
Category:	Security Policy
Associated CVEs:	-
Vendor Reference:	Oracle Lifetime Support Policy for Technology Products Guide
Bugtraq ID:	-
Service Modified:	09/06/2023
User Modified:	-
Edited:	No
PCI Vuln:	Yes

THREAT:

MySQL version 5.5 is detected on the host.

Product Support for MySQL 5.5 ended in December 2018. No further bug fixes, enhancements, security updates or technical support will be available for this release.

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

Customers are advised to update to the latest supported version of MySQL.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

5.5.47-0ubuntu0.14.04.1

5 EOL/Obsolete Software: jQuery 1.x and 2.x Detected

port 80/tcp

QID:	13477

PCI Vuln:	Yes

THREAT:

jQuery is a JavaScript library designed to simplify HTML DOM tree traversal and manipulation, as well as event handling, CSS animation, and Ajax. It is free, open-source software using the permissive MIT License.

jQuery 1.x and 2.x has ended. No further bug fixes, enhancements, security updates or technical support is available for this release.

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

For additional information please refer to: jQuery 1.x and 2.x (<https://github.com/jquery/jquery.com/issues/162>)

Best Security practice is to remove the End of Life software and install a supported version of jQuery.

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

EOL Software:jQuery Version 1.x or 2.x Detected.
jquery-1.4.4.min.js

5 Hypertext Preprocessor (PHP) Multiple Security Vulnerabilities (81738, 81739)		port 80/tcp
QID:	38880	
Category:	General remote services	
Associated CVEs:	CVE-2022-31630 , CVE-2022-37454	
Vendor Reference:	81738 , 81739

PCI Vuln:	Yes	

THREAT:

PHP is a programming language originally designed for use in web-based applications with HTML content. PHP supports a wide variety of platforms and is used by numerous web-based software applications.

CVE-2022-31630: In installed version of PHP, when using imageloadfont() function in gd extension, it is possible to supply a specially crafted font file, such as if the loaded font is used with imagechar() function, the read outside allocated buffer will be used. This can lead to crashes or disclosure of confidential information.

CVE-2022-37454: The Keccak XKCP SHA-3 reference implementation before fdc6fef has an integer overflow and resultant buffer overflow that allows attackers to execute arbitrary code or eliminate expected cryptographic properties.

Affected Versions:

PHP versions before 7.4.33

PHP versions 8.0.0 prior to 8.0.25

PHP versions 8.1.0 prior to 8.1.12

IMPACT:

Successful exploitation of the vulnerability may allow an attacker to crash the PHP process or Denial of Service (DoS) or attackers to execute arbitrary code on the system.

SOLUTION:

Customers are advised to upgrade to the latest version of PHP. (<https://www.php.net/downloads.php>)
For more information please refer to Sec Bug 81739 (<https://bugs.php.net/bug.php?id=81739>) .

Patch:

Following are links for downloading patches to fix the vulnerabilities:

81739 (<https://bugs.php.net/bug.php?id=81739>)

81738 (<http://bugs.php.net/81738>)

Description: The Keccak XKCP SHA-3 reference implementation before fdc6fef has an integer overflow and resultant buffer overflow that allows attackers to execute arbitrary code or eliminate expected cryptographic properties. This occurs in the sponge function interface.

Link: <https://mouha.be/sha-3-buffer-overflow/>

Reference: CVE-2022-31630

Description: In PHP versions prior to 7.4.33, 8.0.25 and 8.2.12, when using imageloadfont() function in gd extension, it is possible to supply a specially crafted font file, such as if the loaded font is used with imagechar() function, the read outside allocated buffer will be used. This can lead to crashes or disclosure of confidential information.

Link: <https://bugs.php.net/bug.php?id=81739>

Connection: close

Content-Type: text/html

 5 Apache httpd Server Uninitialized memory reflection in mod_auth_digest Information Disclosure Vulnerability

port 80/tcp

QID: 87555

Category: Web server

Associated CVEs: [CVE-2017-9788](#)

Vendor Reference: [Apache HTTP Server Security Advisory](#)

Bugtraq ID: -

Service Modified: 09/23/2025

User Modified: -

Edited: No
PCI Vuln: Yes

THREAT:

Apache Web Server is an open-source web server.

Uninitialized memory reflection in mod_auth_digest leading to leakage of potentially confidential information, and a segfault.

Affected Versions:

Apache httpd 2.2.x before 2.2.34

Apache httpd 2.4.x before 2.4.27

IMPACT:

Successful exploitation of this vulnerability may allow an attacker to make the targeted server unavailable and cause denial of service.

SOLUTION:

Customers are advised to upgrade to Apache httpd 2.2.34, 2.4.27 (<https://httpd.apache.org/download.cgi>) or later versions to remediate this vulnerability.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Apache httpd 2.2.34, 2.4.27 or later (<https://httpd.apache.org/download.cgi>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 vulncheck-threat-actors

Reference: CVE-2017-9788

Description: Unattributed

Link: https://www.trendmicro.com/en_us/research/22/b/recent-cyberattacks-open-source-web-servers.html

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable version of Apache HTTP Server detected on port 80 -

Date: Thu, 23 Jul 2026 07:21:30 GMT

 5 EOL/Obsolete Software: Hypertext Preprocessor (PHP) 5.5.x Detected

port 80/tcp

QID: 105675
Category: Security Policy
Associated CVEs: -
Vendor Reference: [PHP End of Life](#)
Bugtraq ID: -
Service Modified: 09/06/2023
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is suited for web development and can be embedded in HTML.

PHP 5.5 series reached End of Life in its support cycle on July 21, 2016.

Since there are no further bug fixes or security updates for PHP 5.5 series, it's highly recommended to migrate from version 5.5 to newer supported versions.

Affected Versions:
PHP 5.5.x versions

IMPACT:

The system is at high risk of being exposed to security vulnerabilities. Since the vendor no longer provides updates, obsolete software is more vulnerable to viruses and other attacks.

SOLUTION:

Upgrade to 5.6 or later. For more information, please refer to the PHP 5.5 to PHP 5.6 Migration Guide (<http://php.net/migration56>).

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

Bugtraq ID: -
Service Modified: 08/20/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is an HTTP web server application.
CVE-2022-28330: Apache HTTP Server 2.4.53 and earlier on Windows may read beyond bounds when configured to process requests with the mod_isapi module.
CVE-2022-28614: The ap_rwrite() function in Apache HTTP Server 2.4.53 and earlier may read unintended memory if an attacker can cause the server to reflect very large input using ap_rwrite() or ap_rputs(), such as with mod_lua's r:puts() function.
CVE-2022-28615: Apache HTTP Server 2.4.53 and earlier may crash or disclose information due to a read beyond bounds in ap_strcmp_match() when provided with an extremely large input buffer.
CVE-2022-29404: In Apache HTTP Server 2.4.53 and earlier, a malicious request to a lua script that calls r:parsebody(0) may cause a denial of service due to no default limit on possible input size.
CVE-2022-30556: Apache HTTP Server 2.4.53 and earlier may return lengths to applications calling r:wsread() that point past the end of the storage allocated for the buffer.

Affected Versions:
Apache HTTP Server versions 2.4.53 and earlier

IMPACT:

Successful exploitation of this vulnerability may compromise Confidentiality, Integrity, and Availability of the Data.

SOLUTION:

Customers are advised to update latest Apache httpd
For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:

 5	Oracle MySQL Multiple Security Vulnerabilities	port 3306/tcp
QID:	20021	
Category:	Database	
Associated CVEs:	CVE-2016-6662 , CVE-2016-6663 , CVE-2016-6664	
Vendor Reference:	CVE-2016-6662 , CVE-2016-6663 , CVE-2016-6664	
Bugtraq ID:	92911,93614,93612,92912	
Service Modified:	03/12/2026	
User Modified:	-	
Edited:	No	
PCI Vuln:	Yes	

THREAT:

Oracle MySQL is an open-source relational database management system (RDBMS).

CVE-2016-6662- A vulnerability exists in the mysqld_safe script which is used by many default installations/packages of MySQL as a wrapper to start the MySQL service process. This script is executed with root privileges and the main mysqld process lowers its privilege level to mysql user. An attacker could exploit this vulnerability by injecting a path to their malicious library within the config, pre-loading an arbitrary library and executing arbitrary code with root privileges when MySQL service is restarted.

CVE-2016-6663/CVE-2016-5616- A race condition was found in the way MySQL performed MyISAM engine table repair. A database user with shell access to the server running mysqld could use this flaw to change permissions of arbitrary files writable by the mysql system user.

CVE-2016-6664/CVE-2016-5617- A flaw was found in the way the mysqld_safe script handled creation of error log file. The mysql operating system user could use this flaw to escalate their privileges to root.

Affected Versions:
Oracle MySQL versions prior to 5.7.15, 5.6.33 and 5.5.52

IMPACT:

Successful exploitation could allow remote, unauthenticated attackers to execute arbitrary code with root privileges which would then allow them to fully compromise the server on which an affected version of MySQL is running.

SOLUTION:

MySQL releases following security fixes: MySQL 5.5.52 (<https://dev.mysql.com/doc/relnotes/mysql/5.5/en/news-5-5-52.html>) MySQL 5.6.33 (<https://dev.mysql.com/doc/relnotes/mysql/5.6/en/news-5-6-33.html>) MySQL 5.7.15 (<https://dev.mysql.com/doc/relnotes/mysql/5.7/en/news-5-7-15.html>)

Workaround:

As a temporary workaround, administrators are advised to ensure that no mysql config files are owned by mysql users. They are also advised to create root-owned dummy my.cnf files if not in use.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Oracle MySQL (<http://dev.mysql.com/downloads/mysql/>)

PCI Vuln: Yes

THREAT:

This Critical Patch Update contains 23 new security fixes for Oracle MySQL.

Affected Versions:
MySQL Server, versions 5.5.56 and prior, 5.6.36 and prior, 5.7.18 and prior

IMPACT:

Successful exploitation could allow an attacker to affect the confidentiality, integrity and availability of data on the target system.

SOLUTION:

Refer to vendor advisory Oracle MySQL JULY 2017
(<http://www.oracle.com/technetwork/security-advisory/cpujul2017-3236622.html#AppendixMSQL>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

Oracle MySQL July 2017 (<http://www.oracle.com/technetwork/security-advisory/cpujul2017-3236622.html#AppendixMSQL>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

There is no exploitability information for this vulnerability.

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable MySQL server detected: 5.5.47-0ubuntu0.14.04.1

4 Apache httpd Server Information Disclosure Vulnerability (OptionsBleed)

QID: 87310
Category: Web server
Associated CVEs: [CVE-2017-9798](#)
Vendor Reference: [Apache httpd 2.4.28](#)
Bugtraq ID: 100872,105598
Service Modified: 03/12/2026
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache Web Server is an open-source web server.

On systems with the Limit directive set within a '.htaccess' file and set to an invalid HTTP method, a remote user can send a specially crafted HTTP OPTIONS request for a path to trigger a use-after-free memory error and view potentially sensitive information from process memory on the target system.

This vulnerability is referred to as "Optionsbleed".

Apache HTTP Server through 2.2.34 and 2.4.x through 2.4.27

IMPACT:

A remote user can obtain potentially sensitive information on the target system in certain cases.

SOLUTION:

The Apache HTTP Project released patch version (2.4.28) to resolve this issue.

Refer to Apache security advisory CVE-2017-9798. (https://httpd.apache.org/security/vulnerabilities_24.html)

If you are using a Linux distribution, please refer to your Linux vendor for further information and updates.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Reference: CVE-2017-9798

Description: Apache httpd allows remote attackers to read secret data from process memory if the Limit directive can be set in a user's .htaccess file, or if httpd.conf has certain misconfigurations, aka Optionsbleed. This affects the Apache HTTP Server through 2.2.34 and 2.4.x through 2.4.27. The attacker sends an unauthenticated OPTIONS HTTP request when attempting to read secret data. This is a use-after-free issue and thus secret data is not always sent, and the specific data depends on many factors incl

4 Apache HTTP Server mod_mime Buffer Overread

QID: 89009
Category: Web server
Associated CVEs: [CVE-2017-7679](#)
Vendor Reference: [Apache httpd 2.4.26](#), [Apache httpd 2.2.34](#)
Bugtraq ID: 99170
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

The Apache Module mod_mime is used to assign content metadata to the content selected for an HTTP response by mapping patterns in the URI or filenames to the metadata values.

In Apache httpd 2.2.x before 2.2.33 and 2.4.x before 2.4.26, mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

IMPACT:

A remote attacker could exploit this vulnerability to read one byte past the end of a buffer which could affect the confidentiality, integrity and availability of data on the target system.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to [Apache httpd 2.4.27 Changelog](#) (https://httpd.apache.org/security/vulnerabilities_24.html), [Apache httpd 2.2.34 Changelog](#) (https://httpd.apache.org/security/vulnerabilities_22.html), or your Linux distro for further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

CVE-2017-7679: Apache 2.2.x (https://httpd.apache.org/security/vulnerabilities_22.html)

Service Modified: 02/29/2024

User Modified: -

Edited: No

PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

Multiple security-related bugs were fixed in this new release, including CVE-2015-3330, CVE-2015-1351, CVE-2015-2783, CVE-2015-3329 and CVE-2015-1352.

Affected Version:

PHP 5.5.x prior to 5.5.24, 5.6.x prior to 5.6.8 and 5.4.x prior versions to 5.4.40.

IMPACT:

Successful exploitation of this vulnerability will allow an attacker to execute arbitrary code, gain access to sensitive information or cause a denial of service.

SOLUTION:

Users are advised to upgrade to the latest version of the PHP. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP (<http://www.php.net/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

Reference: CVE-2015-2783

Description: ext/phar/phar.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allows remote attackers to obtain sensitive information from process memory or cause a denial of service (buffer over-read and application crash) via a crafted length value in conjunction with crafted serialized data in a phar archive, related to the phar_parse_metadata and phar_parse_pharfile functions.

Link: <https://bugs.php.net/bug.php?id=69324>

Reference: CVE-2015-3329

Description: Multiple stack-based buffer overflows in the phar_set_inode function in phar_internal.h in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 allow remote attackers to execute arbitrary code via a crafted length value in a (1) tar, (2) phar, or (3) ZIP archive.

Link: <https://bugs.php.net/bug.php?id=69441>

Reference: CVE-2015-3330

Description: The php_handler function in sapi/apache2handler/sapi_apache2.c in PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8, when the Apache HTTP Server 2.4.x is used, allows remote attackers to cause a denial of service (application crash) or possibly execute arbitrary code via pipelined HTTP requests that result in a "deconfigured interpreter."

Link: <https://bugs.php.net/bug.php?id=69218>

Reference: CVE-2015-3411

Description: PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 does not ensure that pathnames lack %00 sequences, which might allow remote attackers to read or write to arbitrary files via crafted input to an application that calls (1) a DOMDocument load method, (2) the xmlwriter_open_uri function, (3) the finfo_file function, or (4) the hash_hmac_file function, as demonstrated by a filename\0.xml attack that bypasses an intended configuration in which client users may read only .xml files.

Link: <https://bugs.php.net/bug.php?id=69353>

Reference: CVE-2015-3412

Description: PHP before 5.4.40, 5.5.x before 5.5.24, and 5.6.x before 5.6.8 does not ensure that pathnames lack %00 sequences, which might allow remote attackers to read arbitrary files via crafted input to an application that calls the stream_resolve_include_path function in ext/standard/streamsfuncs.c, as demonstrated by a filename\0.extension attack that bypasses an intended configuration in which client users may read files with only one specific extension.

Link: <https://bugs.php.net/bug.php?id=69353>

Reference: CVE-2015-1352

Description: The build_tablename function in pgsql.c in the PostgreSQL (aka postgresql) extension in PHP through 5.6.7 does not validate token extraction for table names, which allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a crafted name.

Link: <https://bugs.php.net/bug.php?id=68741>

Reference: CVE-2015-1351

Description: Use-after-free vulnerability in the `_zend_shared_memdup` function in `zend_shared_alloc.c` in the OPcache extension in PHP through 5.6.7 allows remote attackers to cause a denial of service or possibly have unspecified other impact via unknown vectors.

User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is vulnerable to a remote denial of service, caused by repeatedly allocate memory, concatenate string, copy string and free memory when PHP parses header areas of body part of HTTP request with multipart/form-data. By sending multiple HTTP multipart requests to an affected application containing malicious header area of body part, a remote attacker could exploit this vulnerability to cause the consumption of CPU resources.

Affected Version:
PHP 5.5.x prior to 5.5.25, 5.6.x prior to 5.6.9 and 5.4.x prior versions to 5.4.41

IMPACT:

A remote attacker could exploit this vulnerability to cause the consumption of CPU resources.

SOLUTION:

Users are advised to upgrade to the latest version of the PHP. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.6.9, PHP 5.5.25, PHP 5.4.41 (PHP) (<http://www.php.net/>)

COMPLIANCE:

Service Modified: 02/29/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is exposed to multiple security vulnerabilities:

- OS command injection vulnerability in `escapeshellarg`.(CVE-2015-4642).
- Integer overflow in `ftp_genlist()` resulting in heap overflow.(CVE-2015-4643).
- Upgraded `pcrelib` to 8.37.(CVE-2015-2325, CVE-2015-2326).
- Upgrade bundled `sqlite` to 3.8.10.2. (CVE-2015-3414, CVE-2015-3415, CVE-2015-3416).

Affected Version:
PHP 5.5.x prior to 5.5.26, 5.6.x prior to 5.6.10 and 5.4.x prior versions to 5.4.42

IMPACT:

A remote attacker could exploit this vulnerability to execute arbitrary OS commands in context of the affected application.

SOLUTION:

Users are advised to upgrade to the latest version of the PHP. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

PHP 5.6.10, PHP 5.5.26, PHP 5.4.42 (PHP) (<http://www.php.net/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

nvd

Reference: CVE-2015-2325

Description: The `compile_branch` function in PCRE before 8.37 allows context-dependent attackers to compile incorrect code, cause a denial of service (out-of-bounds heap read and crash), or possibly have other unspecified impact via a regular expression with a group containing a forward reference repeated a large number of times within a repeated outer group that has a zero minimum quantifier.

Link: https://bugs.exim.org/show_bug.cgi?id=1591

Reference: CVE-2015-2326

Description: The `pcre_compile2` function in PCRE before 8.37 allows context-dependent attackers to compile incorrect code and cause a denial of service (out-of-bounds read) via regular expression with a group containing both a forward referencing subroutine call and a recursive back reference, as demonstrated by `"((?+1)(\1))/"`.

Link: https://bugs.exim.org/show_bug.cgi?id=1592

Reference: CVE-2015-4643

Description: Integer overflow in the `ftp_genlist` function in `ext/ftp/ftp.c` in PHP before 5.4.42, 5.5.x before 5.5.26, and 5.6.x before 5.6.10 allows remote FTP servers to execute arbitrary code via a long reply to a LIST command, leading to a heap-based buffer overflow. NOTE: this vulnerability exists because of an incomplete fix for CVE-2015-4022.

Link: <https://bugs.php.net/bug.php?id=69545>

Reference: CVE-2015-4642

Description: The escapeshellarg function in ext/standard/exec.c in PHP before 5.4.42, 5.5.x before 5.5.26, and 5.6.x before 5.6.10 on Windows allows remote attackers to execute arbitrary OS commands via a crafted string to an application that accepts command-line arguments for a call to the PHP system function.

Link: <https://bugs.php.net/bug.php?id=69646>

nist-nvd2

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP Group released version 5.5.32/5.6.18 of PHP, fixing five vulnerabilities.

Affected Versions:

PHP Versions Prior to 5.6.18,5.5.32

IMPACT:

The vulnerabilities can be exploited by malicious users to execute arbitrary code in the context of the application, access sensitive information

or cause denial of service conditions.

SOLUTION:

Users are advised to upgrade to the latest version of the software. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.6.18/5.5.32 (PHP) (<http://www.php.net/>)

COMPLIANCE:

Not Applicable

EXPLOITABILITY:

 nvd

Reference: CVE-2016-2554

Description: Stack-based buffer overflow in ext/phar/tar.c in PHP before 5.5.32, 5.6.x before 5.6.18, and 7.x before 7.0.3 allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact via a crafted TAR archive.

Link: <https://bugs.php.net/bug.php?id=71488>

Reference: CVE-2016-4342

Description: ext/phar/phar_object.c in PHP before 5.5.32, 5.6.x before 5.6.18, and 7.x before 7.0.3 mishandles zero-length uncompressed data, which allows remote attackers to cause a denial of service (heap memory corruption) or possibly have unspecified other impact via a crafted (1) TAR, (2) ZIP, or (3) PHAR archive.

Link: <http://www.openwall.com/lists/oss-security/2016/04/28/2>

Reference: CVE-2016-4343

Description: The phar_make_dirstream function in ext/phar/dirstream.c in PHP before 5.6.18 and 7.x before 7.0.3 mishandles zero-size ./@LongLink files, which allows remote attackers to cause a denial of service (uninitialized pointer dereference) or possibly have unspecified other impact via a crafted TAR archive.

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP Group released version 5.6.2/5.5.18/5.4.34 of PHP, fixing multiple vulnerabilities.

Affected Versions:
PHP Versions Prior to 5.6.2/5.5.18/5.4.34

IMPACT:

The vulnerabilities can be exploited by malicious users to execute arbitrary code in the context of the application, access sensitive information or cause denial of service conditions.

SOLUTION:

Users are advised to upgrade to the latest version of the software. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Patch:
Following are links for downloading patches to fix the vulnerabilities:

PHP 5.6.2/5.5.18/5.4.34 (php) (<http://www.php.net/>)

COMPLIANCE:

PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is exposed to multiple remote security vulnerabilities.

- 1) Extensive backtracking in rule regular expression (CVE-2014-3538).
 - 2) Possible buffer overflow in `dns_get_record` (CVE-2014-3597).
 - 3) Segfault in "cdf.c" (CVE-2014-3587).
 - 4) `php-gd "c_color"` NULL pointer dereference (CVE-2014-2497).
 - 5) Null byte injection possible with `imagexxx` functions (CVE-2014-5120).
 - 6) An use-after-free issue due to object change during sorting (CVE-2014-4698).
 - 7) An use-after-free issue in SPL Iterators (CVE-2014-4670).
- Affected Versions:
PHP 5.x prior to 5.4.32/5.5.16.

IMPACT:

By exploiting this vulnerability, attackers can cause a denial of service or execute arbitrary code.

SOLUTION:

Update to version 5.4.32 or 5.5.16. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Patch:

Following are links for downloading patches to fix the vulnerabilities:

PHP 5.5.16 (<http://us1.php.net/distributions/php-5.5.16.tar.bz2>)

PHP 5.4.32 (<http://us1.php.net/distributions/php-5.4.32.tar.bz2>)

COMPLIANCE:

Not Applicable

4 PHP "unserialize()" Use-After-Free Vulnerability

port 80/tcp

QID: 13083
Category: CGI
Associated CVEs: CVE-2014-8142

Vendor Reference: [PHP](#)
Bugtraq ID: 71791
Service Modified: 02/28/2024
User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

An use after free vulnerability has been confirmed in PHP which exist in the process_nested_data function in ext/standard/var_unserializer.re. The vulnerability existed as the language failed to properly handle object properties.

Affected Versions:

PHP versions prior to 5.4.36, 5.5.x before 5.5.20, and 5.6.x before 5.6.4

IMPACT:

Successful exploitation of this vulnerability will allow an attacker to execute arbitrary code, failed exploits may result in denial of service.

SOLUTION:

Users are advised to upgrade to the latest version of the PHP. For more information, please refer to the PHP Web site (<http://www.php.net/>).

Reference: CVE-2015-0235

Description: Exim ESMTP 4.80 - glibc gethostbyname Denial of Service

Link: <https://www.exploit-db.com/exploits/35951>

Reference: CVE-2015-0235

Description: Exim - 'GHOST' glibc gethostbyname Buffer Overflow (Metasploit)

Link: <https://www.exploit-db.com/exploits/36421>

 nvd

Reference: CVE-2014-9705

Description: Heap-based buffer overflow in the `enchant_broker_request_dict` function in `ext/enchant/enchant.c` in PHP before 5.4.38, 5.5.x before 5.5.22, and 5.6.x before 5.6.6 allows remote attackers to execute arbitrary code via vectors that trigger creation of multiple dictionaries.

Link: <https://www.htbridge.com/advisory/HTB23252>

Reference: CVE-2014-9705

Description: Heap-based buffer overflow in the `enchant_broker_request_dict` function in `ext/enchant/enchant.c` in PHP before 5.4.38, 5.5.x before 5.5.22, and 5.6.x before 5.6.6 allows remote attackers to execute arbitrary code via vectors that trigger creation of multiple dictionaries.

Link: <https://bugs.php.net/bug.php?id=68552>

Reference: CVE-2015-0273

Description: Multiple use-after-free vulnerabilities in `ext/date/php_date.c` in PHP before 5.4.38, 5.5.x before 5.5.22, and 5.6.x before 5.6.6 allow remote attackers to execute arbitrary code via crafted serialized input containing a (1) R or (2) r type specifier in (a) `DateTimeZone` data handled by the `php_date_timezone_initialize_from_hash` function or (b) `DateTime` data handled by the `php_date_initialize_from_hash` function.

Link: <https://bugs.php.net/bug.php?id=68942>

Reference: CVE-2015-2301

Description: Use-after-free vulnerability in the `phar_rename_archive` function in `phar_object.c` in PHP before 5.5.22 and 5.6.x before 5.6.6 allows remote attackers to cause a denial of service or possibly have unspecified other impact via vectors that trigger an attempted renaming of a Phar archive to the name of an existing file.

Link: <https://bugs.php.net/bug.php?id=68901>

Reference: CVE-2015-2301

Description: Use-after-free vulnerability in the `phar_rename_archive` function in `phar_object.c` in PHP before 5.5.22 and 5.6.x before 5.6.6 allows remote attackers to cause a denial of service or possibly have unspecified other impact via vectors that trigger an attempted renaming of a Phar archive to the name of an existing file.

Link: <http://openwall.com/lists/oss-security/2015/03/15/6>

Reference: CVE-2015-8866

Description: `ext/libxml/libxml.c` in PHP before 5.5.22 and 5.6.x before 5.6.6, when PHP-FPM is used, does not isolate each thread from `libxml_disable_entity_loader` changes in other threads, which allows remote attackers to conduct XML External Entity (XXE) and XML Entity Expansion (XEE) attacks via a crafted XML document, a related issue to CVE-2015-5161.

Link: <https://bugs.php.net/bug.php?id=64938>

Reference: CVE-2015-0235

Description: Heap-based buffer overflow in the `__nss_hostname_digits_dots` function in `glibc 2.2`, and other 2.x versions before 2.18, allows context-dependent attackers to execute arbitrary code via vectors related to the (1) `gethostbyname` or (2) `gethostbyname2` function, aka "GHOST."

 PCI Vuln: Yes

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is exposed to the following vulnerabilities:

Heap Buffer Overflow (READ: 4) in "phar_parse_pharfile". (CVE-2018-20783)
 imap_open allows to run arbitrary shell commands via mailbox parameter). (CVE-2018-19518)

Affected Versions:
 PHP before 5.6.39, 7.x before 7.0.33, 7.1.x before 7.1.25, and 7.2.x before 7.2.13.

IMPACT:

Attackers can exploit this issue to execute arbitrary command within the context of user running the affected application.

SOLUTION:

Customers are advised to upgrade to the latest version of PHP. (<https://www.php.net/downloads.php>)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

php download (<https://www.php.net/downloads>)

COMPLIANCE:

THREAT:

PHP is a general purpose scripting language that is especially suited for web development and can be embedded into HTML.

PHP is exposed to the following vulnerabilities:

Int Overflow lead to Heap OverFlow in exif_thumbnail_extract of exif.c. (CVE-2018-14883)

heap-buffer-overflow while reading exif data. (CVE-2018-14851)

windows linkinfo lacks openbasedir check. (CVE-2018-15132)

Affected Versions:

Versions prior to PHP 5.6.37, 7.1.20, 7.2.8, and 7.0.31 are vulnerable.

IMPACT:

Successful exploitation allows attacker to compromise the system.

SOLUTION:

Customers are advised to upgrade to the latest version of PHP. (<https://www.php.net/downloads.php>)

Patch:

Following are links for downloading patches to fix the vulnerabilities:

php download (<https://www.php.net/downloads>)

COMPLIANCE:

THREAT:

Apache HTTP Server is an HTTP web server application.

Apache HTTP Server is exposed to following vulnerabilities:

- Apache HTTP Request Parsing Whitespace Defects (CVE-2016-8743).
- HTTP/2 CONTINUATION denial of service (CVE-2016-8740).
- DoS vulnerability in mod_auth_digest (CVE-2016-2161).
- Padding Oracle in Apache mod_session_crypto (CVE-2016-0736)
- HTTP_PROXY environment variable "httpoxy" mitigation (CVE-2016-5387)

Affected Versions:

Apache HTTP Server versions 2.4.x prior to 2.4.25

IMPACT:

Successfully exploiting these vulnerabilities might allow a remote attacker to bypass intended access restrictions or cause denial of service.

SOLUTION:

These vulnerabilities have been patched in Apache. Refer to Apache httpd 2.4.25 Changelog (https://httpd.apache.org/security/vulnerabilities_24.html) or your Linux distro for further details.

Patch:

Following are links for downloading patches to fix the vulnerabilities:

Reference: CVE-2016-8740
Description: The mod_http2 module in the Apache HTTP Server 2.4.17 through 2.4.23, when the Protocols configuration includes h2 or h2c, does not restrict request-header length, which allows remote attackers to cause a denial of service (memory consumption) via crafted CONTINUATION frames in an HTTP/2 request.
Link: <http://packetstormsecurity.com/files/140023/Apache-HTTPD-Web-Server-2.4.23-Memory-Exhaustion.html>

Reference: CVE-2016-0736
Description: In Apache HTTP Server versions 2.4.0 to 2.4.23, mod_session_crypto was encrypting its data/cookie using the configured ciphers with possibly either CBC or ECB modes of operation (AES256-CBC by default), hence no selectable or builtin authenticated encryption. This made it vulnerable to padding oracle attacks, particularly with CBC.

Apache HTTP Server versions prior to 2.4.46.

NOTE:
CVE-2021-26691, CVE-2021-26690, CVE-2020-35452, CVE-2020-13938 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41, 2.4.39, 2.4.38, 2.4.37, 2.4.35, 2.4.34, 2.4.33, 2.4.29, 2.4.28, 2.4.27, 2.4.26, 2.4.25, 2.4.23, 2.4.20, 2.4.18, 2.4.17, 2.4.16, 2.4.12, 2.4.10, 2.4.9, 2.4.7, 2.4.6, 2.4.4, 2.4.3, 2.4.2, 2.4.1, 2.4.0.
CVE-2019-17567 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41, 2.4.39, 2.4.38, 2.4.37, 2.4.35, 2.4.34, 2.4.33, 2.4.29, 2.4.28, 2.4.27, 2.4.26, 2.4.25, 2.4.23, 2.4.20, 2.4.18, 2.4.17, 2.4.16, 2.4.12, 2.4.10, 2.4.9, 2.4.7, 2.4.6
CVE-2021-30641 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41, 2.4.39
CVE-2020-13950 affects to Apache HTTP Server versions 2.4.46, 2.4.43, 2.4.41

IMPACT:

Successful exploitation of this vulnerability may allow an attacker to execute arbitrary code on the target.

SOLUTION:

Customers are advised to update Apache httpd 2.4.48.
For more information, visit here (https://httpd.apache.org/security/vulnerabilities_24.html).

Patch:
Following are links for downloading patches to fix the vulnerabilities:
Apache HTTP Server 2.4.47 (https://httpd.apache.org/security/vulnerabilities_24.html)

COMPLIANCE:

Not Applicable

ASSOCIATED MALWARE:

There is no malware information for this vulnerability.

RESULTS:

Vulnerable Apache HTTP Server detected on port 80 -
Date: Thu, 23 Jul 2026 07:21:30 GMT
Server: Apache/2.4.7 (Ubuntu)
X-Powered-By: PHP/5.5.9-1ubuntu4.14
Location: portal.php
Content-Length: 0
Connection: close
Content-Type: text/html/Vulnerable Version of Apache HTTP Server Detected on port: 80
Server: Apache/2.4.7 (Ubuntu)

 4	Apache Hypertext Transfer Protocol Server (HTTP Server) Multiple Vulnerabilities	port 80/tcp
QID:	730209	
Category:	CGI	
Associated CVEs:	CVE-2021-34798 , CVE-2021-39275 , CVE-2021-40438	
Vendor Reference:	Apache HTTP Server 2.4.49 Advisory	
Bugtraq ID:	-	
Service Modified:	07/21/2026	

User Modified: -
Edited: No
PCI Vuln: Yes

THREAT:

Apache HTTP Server is a free and open-source cross-platform web server software, released under the terms of Apache License 2.0.

Affected Versions:
Apache HTTP Server 2.4.48 and earlier

IMPACT:

Successful exploitation of this vulnerability may allow an attacker to execute arbitrary code on the target.

SOLUTION:

Customers are advised to update to Apache HTTP Server 2.4.49 or later. For more information, check Apache Security Advisory (https://httpd.apache.org/security/vulnerabilities_24.html)
